1 Relational Data Model

2 Main Phases of Database Design

3 ER-/EER-to-Relational Mapping

Relational Data Model

- ▶ Basic Concepts: relational data model, relation schema, domain, tuple, cardinality & degree, database schema, etc.
- ▶ Relational Integrity Constraints
 - ▶ key, primary key & foreign key
 - ▶ entity integrity constraint
 - ▶ referential integrity
- ▶ Update Operations on Relations

Basic Concepts

- ▶ The relational model of data is based on the concept of a relation
- ▶ A relation is a mathematical concept based on the ideas of sets
- ▶ The model was first proposed by Dr. E.F. Codd of IBM in 1970 in the following paper:
"A Relational Model for Large Shared Data Banks,"
Communications of the ACM, June 1970

Basic Concepts

- ▶ **Relational data model:** represents a database in the form of **relations** - 2-dimensional table with rows and columns of data. A database may contain one or more such tables. A relation schema is used to describe a relation.
- ▶ **Relation schema:** $R(A_1, A_2, \dots, A_n)$ is made up of a relation name R and a list of **attributes** A_1, A_2, \dots, A_n . Each attribute A_i is the name of a role played by some domain D in the relation schema R . R is called the **name** of this relation.

Basic Concepts

- ▶ The **degree of a relation** is the number of attributes n of its relation schema.
- ▶ **Domain D**: D is called the domain of A_i and is denoted by $dom(A_i)$. It is a set of atomic values and a set of integrity constraints
 - ▶ STUDENT(Name, SSN, HomePhone, Address, OfficePhone, Age, GPA)
 - ▶ Degree = ?
 - ▶ $dom(GPA) = ?$

Basic Concepts

- ▶ **Tuple:** row/record in table
- ▶ **Cardinality:** number of tuples in a table
- ▶ **Database schema** $S = \{R_1, R_2, \dots, R_m\}$

EMPLOYEE

Schema diagram for
the COMPANY
relational database
schema

Basic Concepts

- ▶ A **relation** r (or **relation state**, **relation instance**) of the relation schema $R(A_1, A_2, \dots, A_n)$, also denoted by $r(R)$, is a set of **n-tuples** $r = \{t_1, t_2, \dots, t_m\}$.
- ▶ Each n-tuple t is an ordered list of n values $t = \langle v_1, v_2, \dots, v_n \rangle$, where each value v_i , $i=1..n$, is an element of $\text{dom}(A_i)$ or is a special **null** value. The i^{th} value in tuple t , which corresponds to the attribute A_i , is referred to as $t[A_i]$.

Basic Concepts

Relational data model

Database schema

Relation schema

Relation

Tuple

Attribute

Basic Concepts

- ▶ A relation can be conveniently represented by a table, as the example shows.
- ▶ The columns of the tabular relation represent attributes.
- ▶ Each attribute has a distinct name, and is always referenced by that name, never by its position
- ▶ Each row of the table represents a tuple. The ordering of the tuples is immaterial and all tuples must be distinct

Basic Concepts

The diagram illustrates the components of a database relation. The table is labeled 'STUDENT' in the first column. The first row contains the attribute names: Name, SSN, HomePhone, Address, OfficePhone, Age, and GPA. The subsequent five rows contain student records. Annotations with arrows point to various parts of the table: 'Relation name' points to the 'STUDENT' header; 'Attributes' points to the attribute headers; 'Tuples' points to the individual rows of data.

STUDENT	Name	SSN	HomePhone	Address	OfficePhone	Age	GPA
	Benjamin Bayer	305-61-2435	373-1616	2918 Bluebonnet Lane	null	19	3.21
	Katherine Ashly	381-62-1245	375-4409	125 Kirby Road	null	18	2.89
	Dick Davidson	422-11-2320	null	3452 Elgin Road	749-1253	25	3.53
	Charles Cooper	489-22-1100	376-9821	265 Lark Lane	749-6492	28	3.93
	Barbara Benson	533-69-1238	839-8461	7384 Fontana Lane	null	19	3.25

Alternative Terminology for Relational Model

Formal Terms	Informal Terms
Relation	Table
Attribute	Column Header
Domain	All possible Column Values
Tuple	Row
Schema of a Relation	Table Definition
State of the Relation	Populated Table

Relational Integrity Constraints

- ▶ Constraints are **conditions** that must hold on **all** valid relation instances. There are three main types of constraints:
 - ▶ Key constraints
 - ▶ Entity integrity constraints
 - ▶ Referential integrity constraints

Relational Integrity Constraints

▶ **Null** value

- ▶ Represents value for an attribute that is currently unknown or inapplicable for tuple.
- ▶ Deals with incomplete or exceptional data.
- ▶ Represents the absence of a value and is not the same as zero or spaces, which are values.

Relational Integrity Constraints - Key Constraints

- ▶ **Superkey** of R: A set of attributes SK of R such that no two tuples in any valid relation instance $r(R)$ will have the same value for SK. That is, for any distinct tuples t_1 and t_2 in $r(R)$, $t_1[SK] \neq t_2[SK]$.
- ▶ **Key** of R: A "minimal" superkey; that is, a superkey K such that removal of any attribute from K results in a set of attributes that is not a superkey.

Relational Integrity Constraints - Key Constraints

- ▶ Example: The CAR relation schema:
 - ▶ CAR(State, Reg#, SerialNo, Make, Model, Year) has two keys:
 - ▶ Key1 = {State, Reg#}, Key2 = {SerialNo}
 - ▶ which are also superkeys
 - ▶ {SerialNo, Make} is a superkey but not a key.
- ▶ If a relation has several **candidate** keys, one is chosen arbitrarily to be the **primary** key. The primary key attributes are **underlined**.

Relational Integrity Constraints - Key Constraints

- ▶ The CAR relation, with two candidate keys: License_Number and Engine_Serial_Number

CAR

<u>License_number</u>	Engine_serial_number	Make	Model	Year
Texas ABC-739	A69352	Ford	Mustang	02
Florida TVP-347	B43696	Oldsmobile	Cutlass	05
New York MPO-22	X83554	Oldsmobile	Delta	01
California 432-TFY	C43742	Mercedes	190-D	99
California RSK-629	Y82935	Toyota	Camry	04
Texas RSK-629	U028365	Jaguar	XJS	04

Relational Integrity Constraints - Entity Integrity

- ▶ **Relational Database Schema:** A set S of relation schemas that belong to the same database. S is the name of the database: $S = \{R_1, R_2, \dots, R_n\}$
- ▶ **Entity Integrity:** primary key attributes PK of each relation schema R in S cannot have null values in any tuple of $r(R)$ because primary key values are used to identify the individual tuples: $t[PK] \neq \text{null}$ for any tuple t in $r(R)$
 - ▶ Note: Other attributes of R may be similarly constrained to disallow null values, even though they are not members of the primary key

Relational Integrity Constraints - Referential Integrity

- ▶ A constraint involving two relations (the previous constraints involve a single relation)
- ▶ Used to specify a relationship among tuples in two relations: the referencing relation and the referenced relation
- ▶ Tuples in the referencing relation R_1 have attributes FK (called foreign key attributes) that reference the primary key attributes PK of the referenced relation R_2 . A tuple t_1 in R_1 is said to reference a tuple t_2 in R_2 if $t_1[\text{FK}] = t_2[\text{PK}]$
- ▶ A referential integrity constraint can be displayed in a relational database schema as a directed arc from $R_1.\text{FK}$ to R_2

Relational Integrity Constraints - Referential Integrity

Ahmad	V	Jabbar	987987987	1969-03-29	980 Dallas, Houston, TX	M	25000	987654321	4
James	E	Borg	888665555	1937-11-10	450 Stone, Houston, TX	M	55000	null	1

Relational Integrity Constraints - Referential Integrity

- ▶ The value in the foreign key column (or columns) FK of the referencing relation R_1 can be either:
 - ▶ (1) a value of an existing primary key value of the corresponding primary key PK in the referenced relation R_2 , or
 - ▶ (2) a NULL
- ▶ In case (2), the FK in R_1 should not be a part of its own primary key

Referential integrity constraints displayed on the COMPANY relational database schema

Relational Integrity Constraints - Other Types of Constraints

▶ **Semantic Integrity Constraints:**

- ▶ based on application semantics and cannot be expressed by the model per se
- ▶ E.g., “the max. no. of hours per employee for all projects he or she works on is 56 hrs per week”
- ▶ A constraint specification language may have to be used to express these
- ▶ SQL-99 allows triggers and ASSERTIONS to allow for some of these
- ▶ State/static constraints (so far)
- ▶ Transition/dynamic constraints: e.g., “the salary of an employee can only increase”

Update Operations on Relations

- ▶ INSERT a tuple
 - ▶ DELETE a tuple
 - ▶ MODIFY a tuple
-
- ▶ Integrity constraints should not be violated by the update operations

Update Operations on Relations

- ▶ **Insertion:** to insert a new tuple t into a relation R .
When inserting a new tuple, it should make sure that the database constraints are not violated:
 - ▶ The value of an attribute should be of the correct data type (i.e. from the appropriate domain).
 - ▶ The value of a prime attribute (i.e. the key attribute) must not be null
 - ▶ The key value(s) must not be the same as that of an existing tuple in the same relation
 - ▶ The value of a foreign key (if any) must refer to an existing tuple in the corresponding relation
- ▶ Options if the constraints are violated: *Homework !!*

Update Operations on Relations

- ▶ **Deletion:** to remove an existing tuple t from a relation R . When deleting a tuple, the following constraints must not be violated:
 - ▶ The tuple must already exist in the database
 - ▶ The referential integrity constraint is not violated
- ▶ **Modification:** to change values of some attributes of an existing tuple t in a relation R

Update Operations on Relations

- ▶ In case of integrity violation, several actions can be taken:
 - ▶ Cancel the operation that causes the violation (REJECT option)
 - ▶ Perform the operation but inform the user of the violation
 - ▶ Trigger additional updates so the violation is corrected (CASCADE option, SET NULL option)
 - ▶ Execute a user-specified error-correction routine
- ▶ Again, homework !!

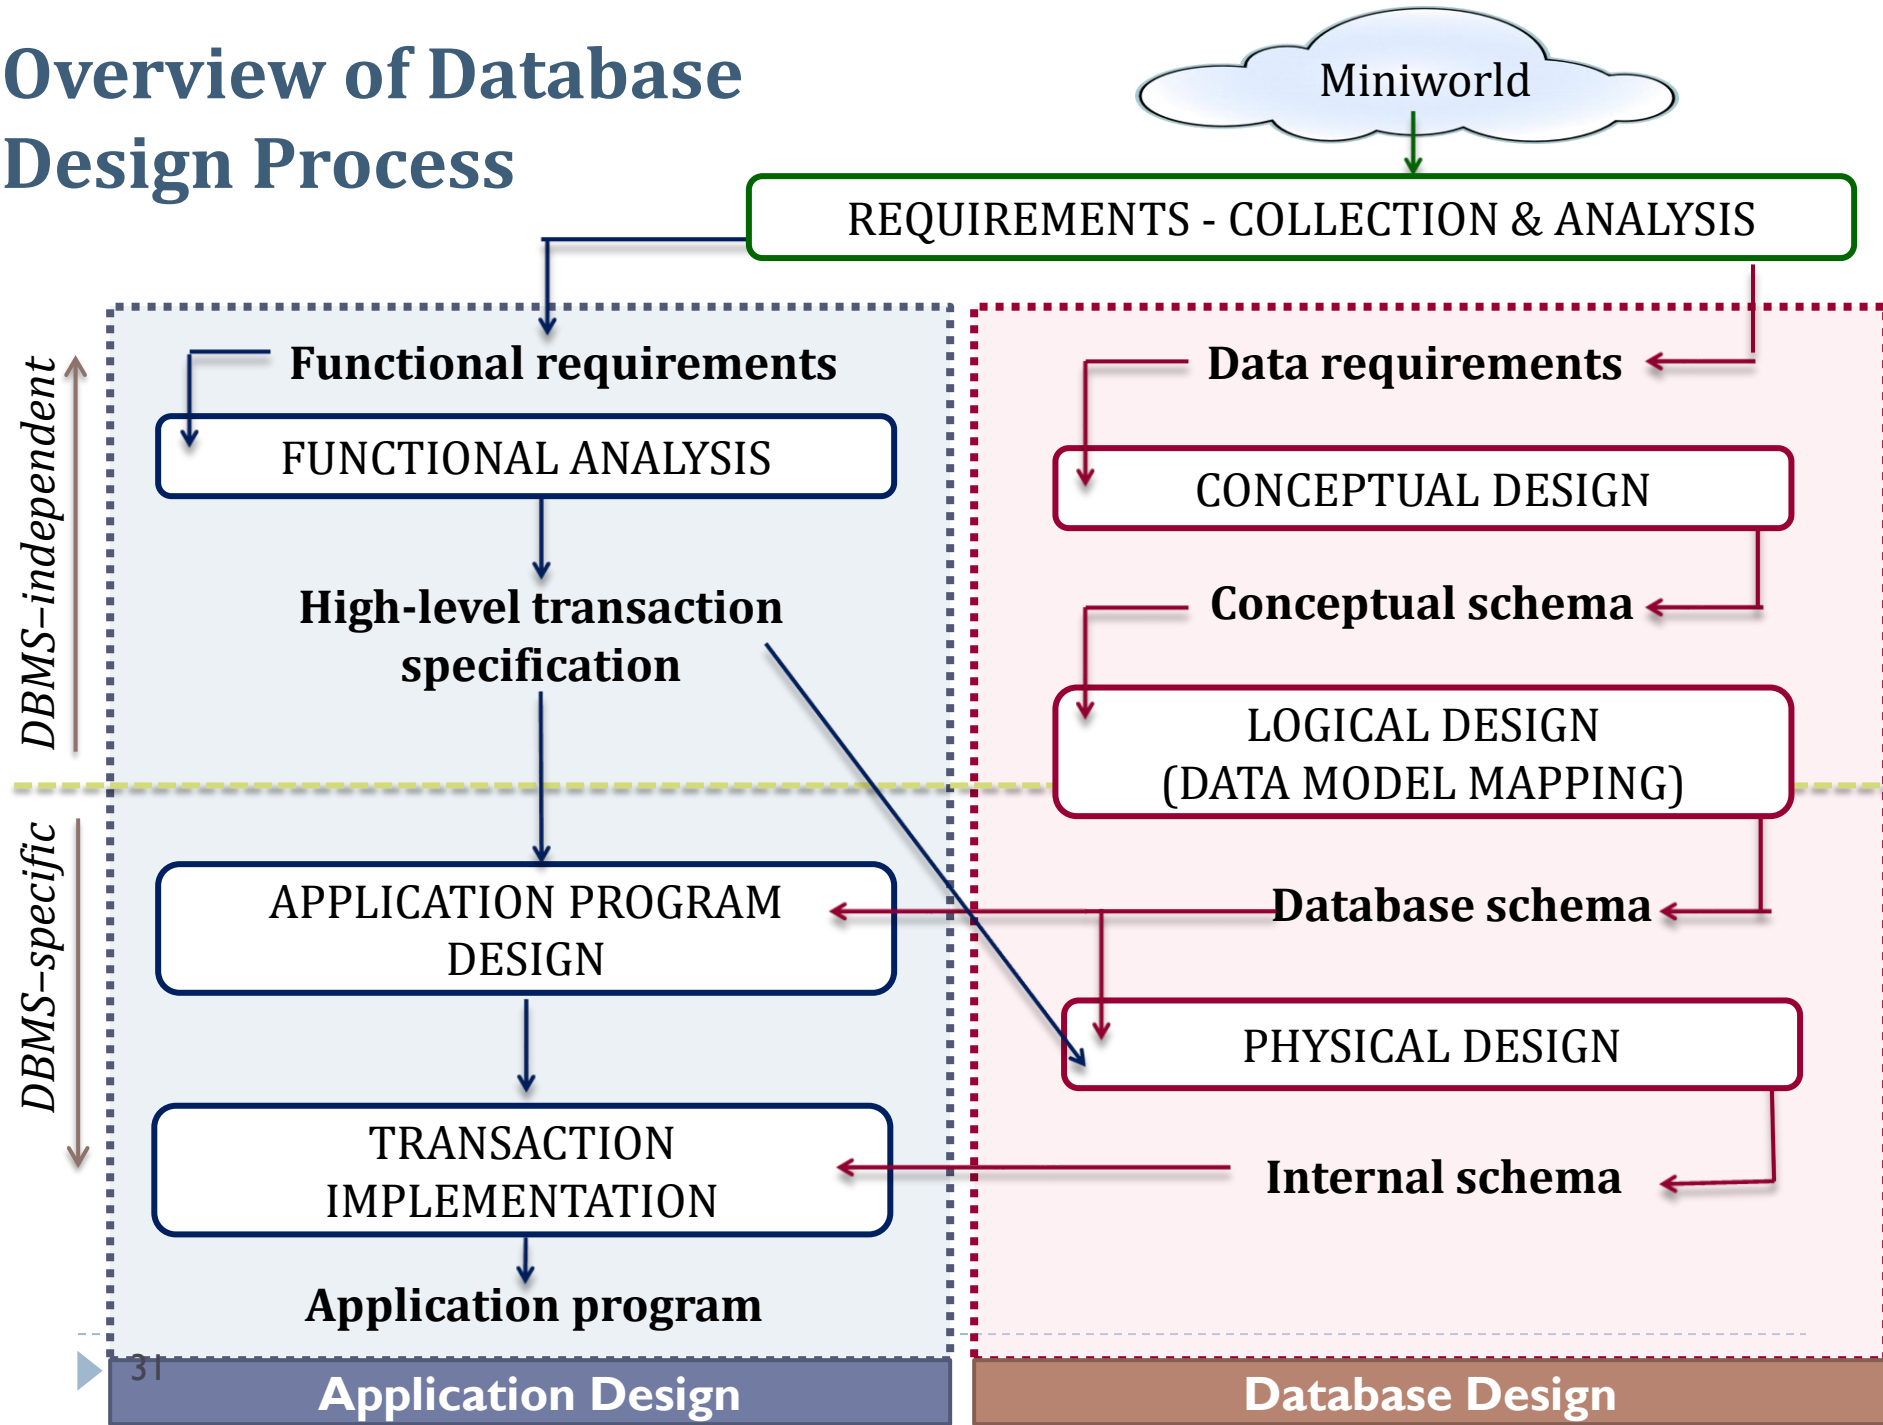

Contents

-

 - 2 Main Phases of Database Design**
 - 3 ER-/EER-to-Relational Mapping
-

Main Phases of Database Design

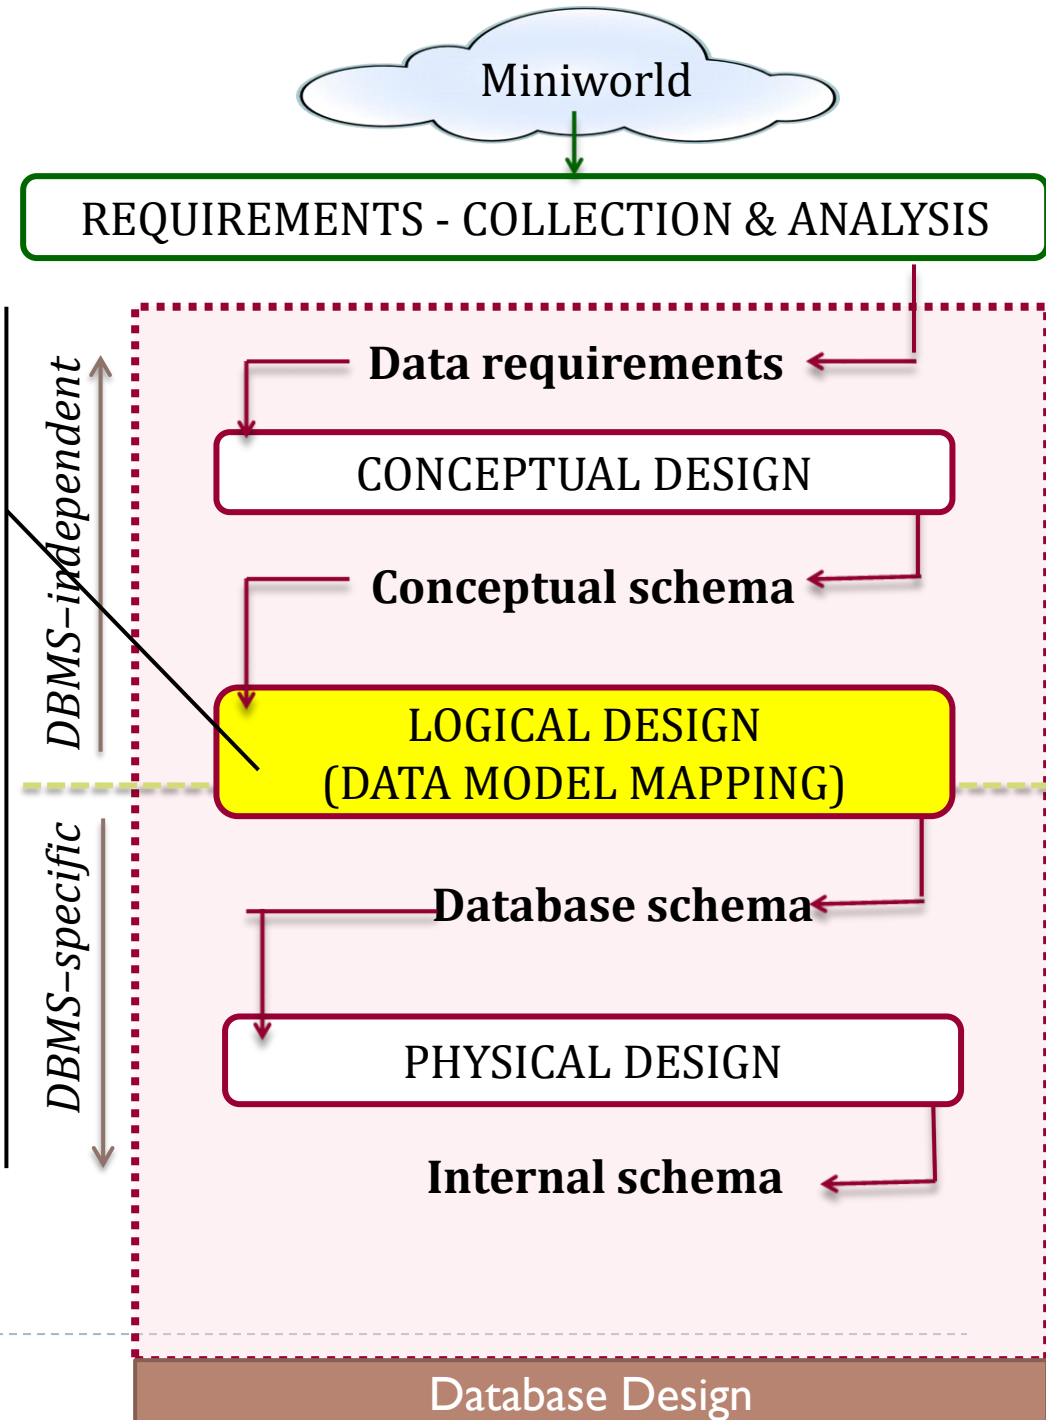

- ▶ Three main phases
 - ▶ Conceptual database design
 - ▶ Logical database design
 - ▶ Physical database design

Overview of Database Design Process

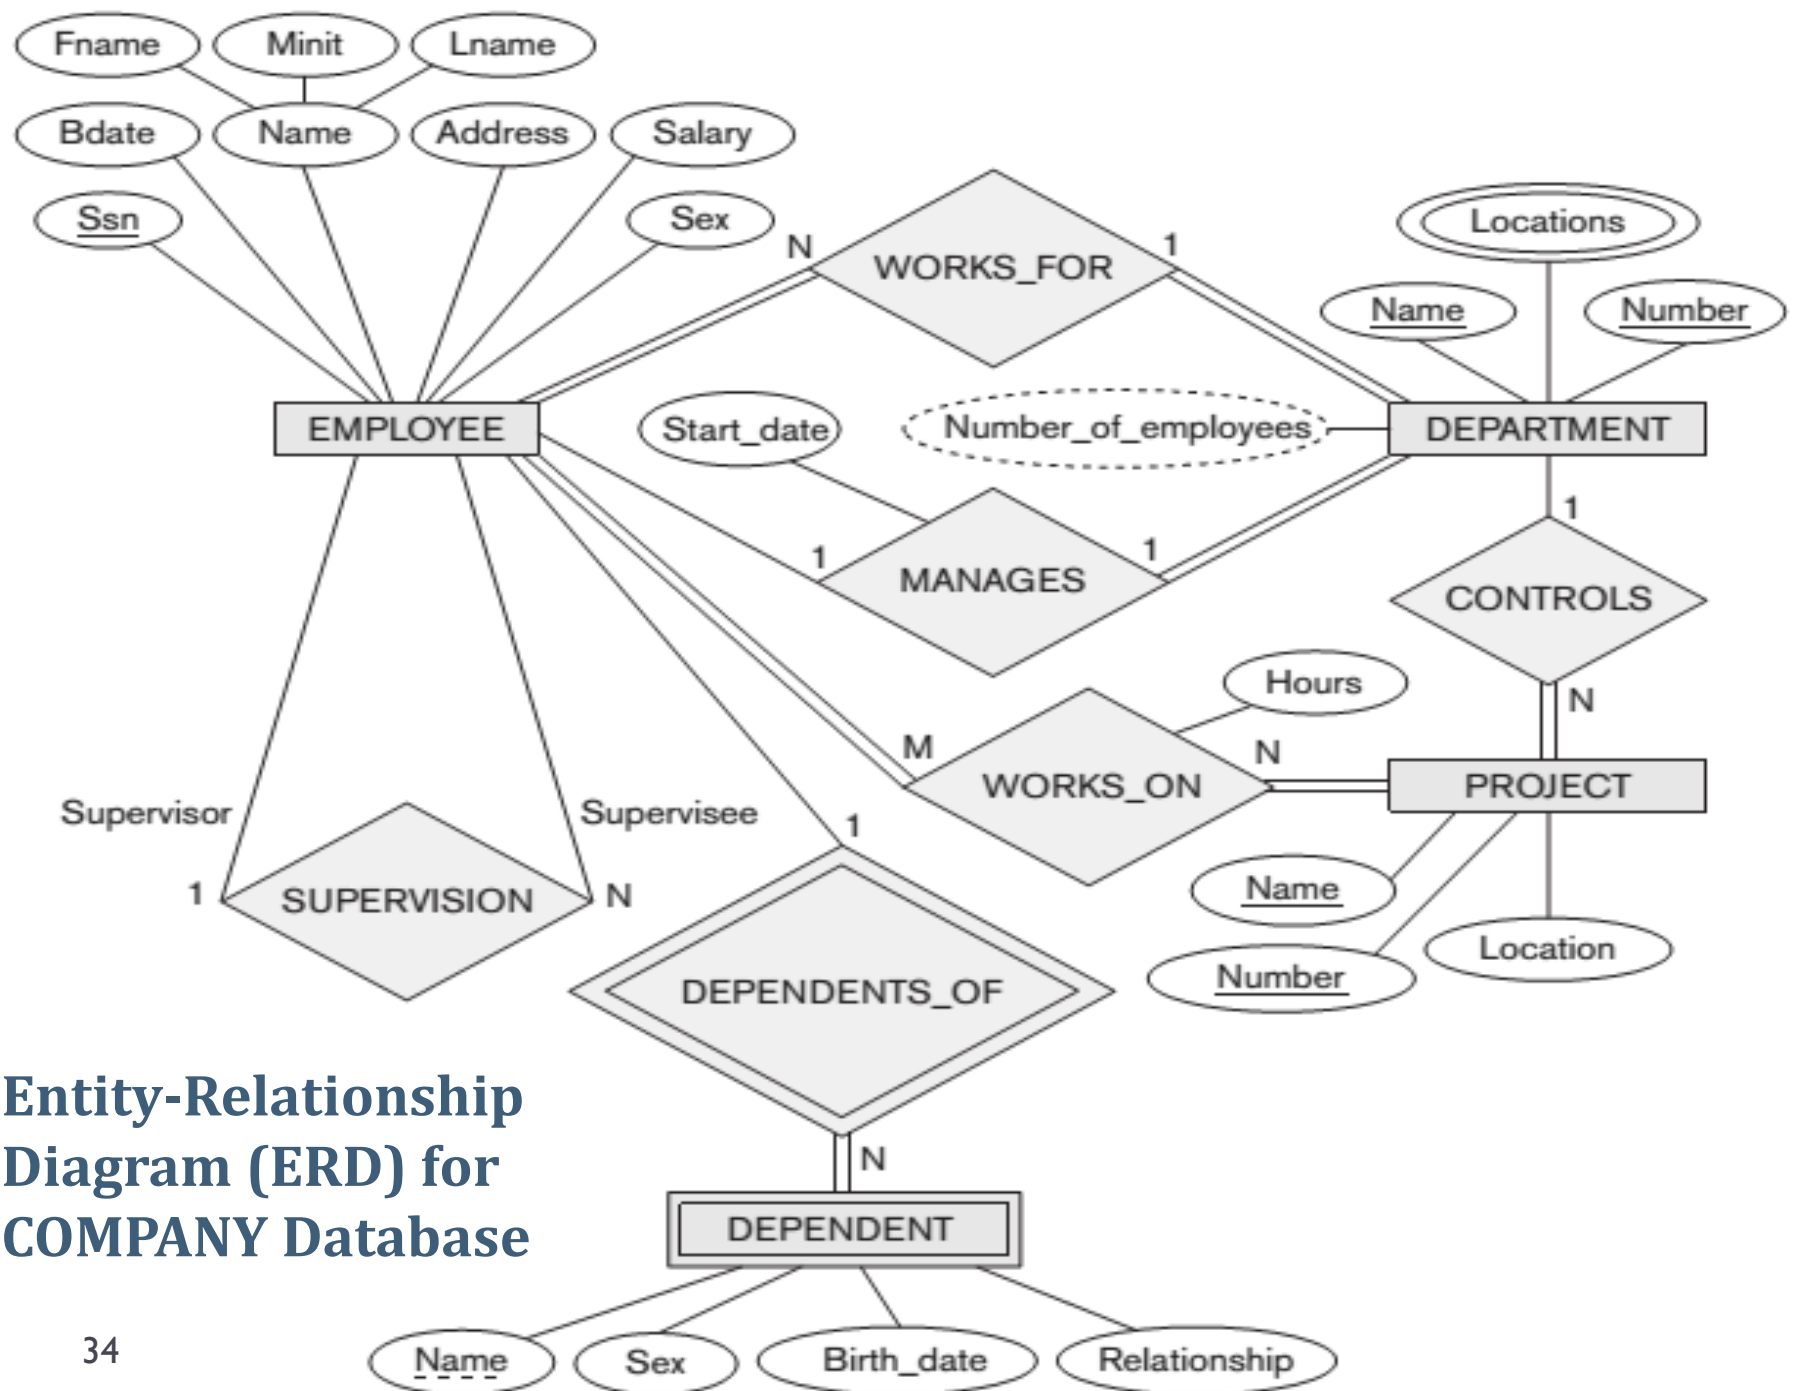

Overview of Database Design Process

- Create a **database schema** in implementation data model of a commercial DBMS
- **Data model mapping** is often automated or semi-automated within the database design tool.

Main Phases of Database Design

- ▶ Logical database design
 - ▶ The process of constructing a model of the data used in an enterprise based on a specific data model (e.g. relational), but independent of a particular DBMS and other physical considerations
 - ▶ ER- & EER-to-Relational Mapping
 - ▶ *Normalization*

Result of mapping the ERD into a relational schema

-

ER- & EER-to-Relational Mapping

▶ ER-

- ▶ Step 1: Mapping of Regular Entity Types
- ▶ Step 2: Mapping of Weak Entity Types
- ▶ Step 3: Mapping of Binary 1:1 Relationship Types
- ▶ Step 4: Mapping of Binary 1:N Relationship Types
- ▶ Step 5: Mapping of Binary M:N Relationship Types
- ▶ Step 6: Mapping of Multivalued attributes
- ▶ Step 7: Mapping of N-ary Relationship Types

▶ EER-

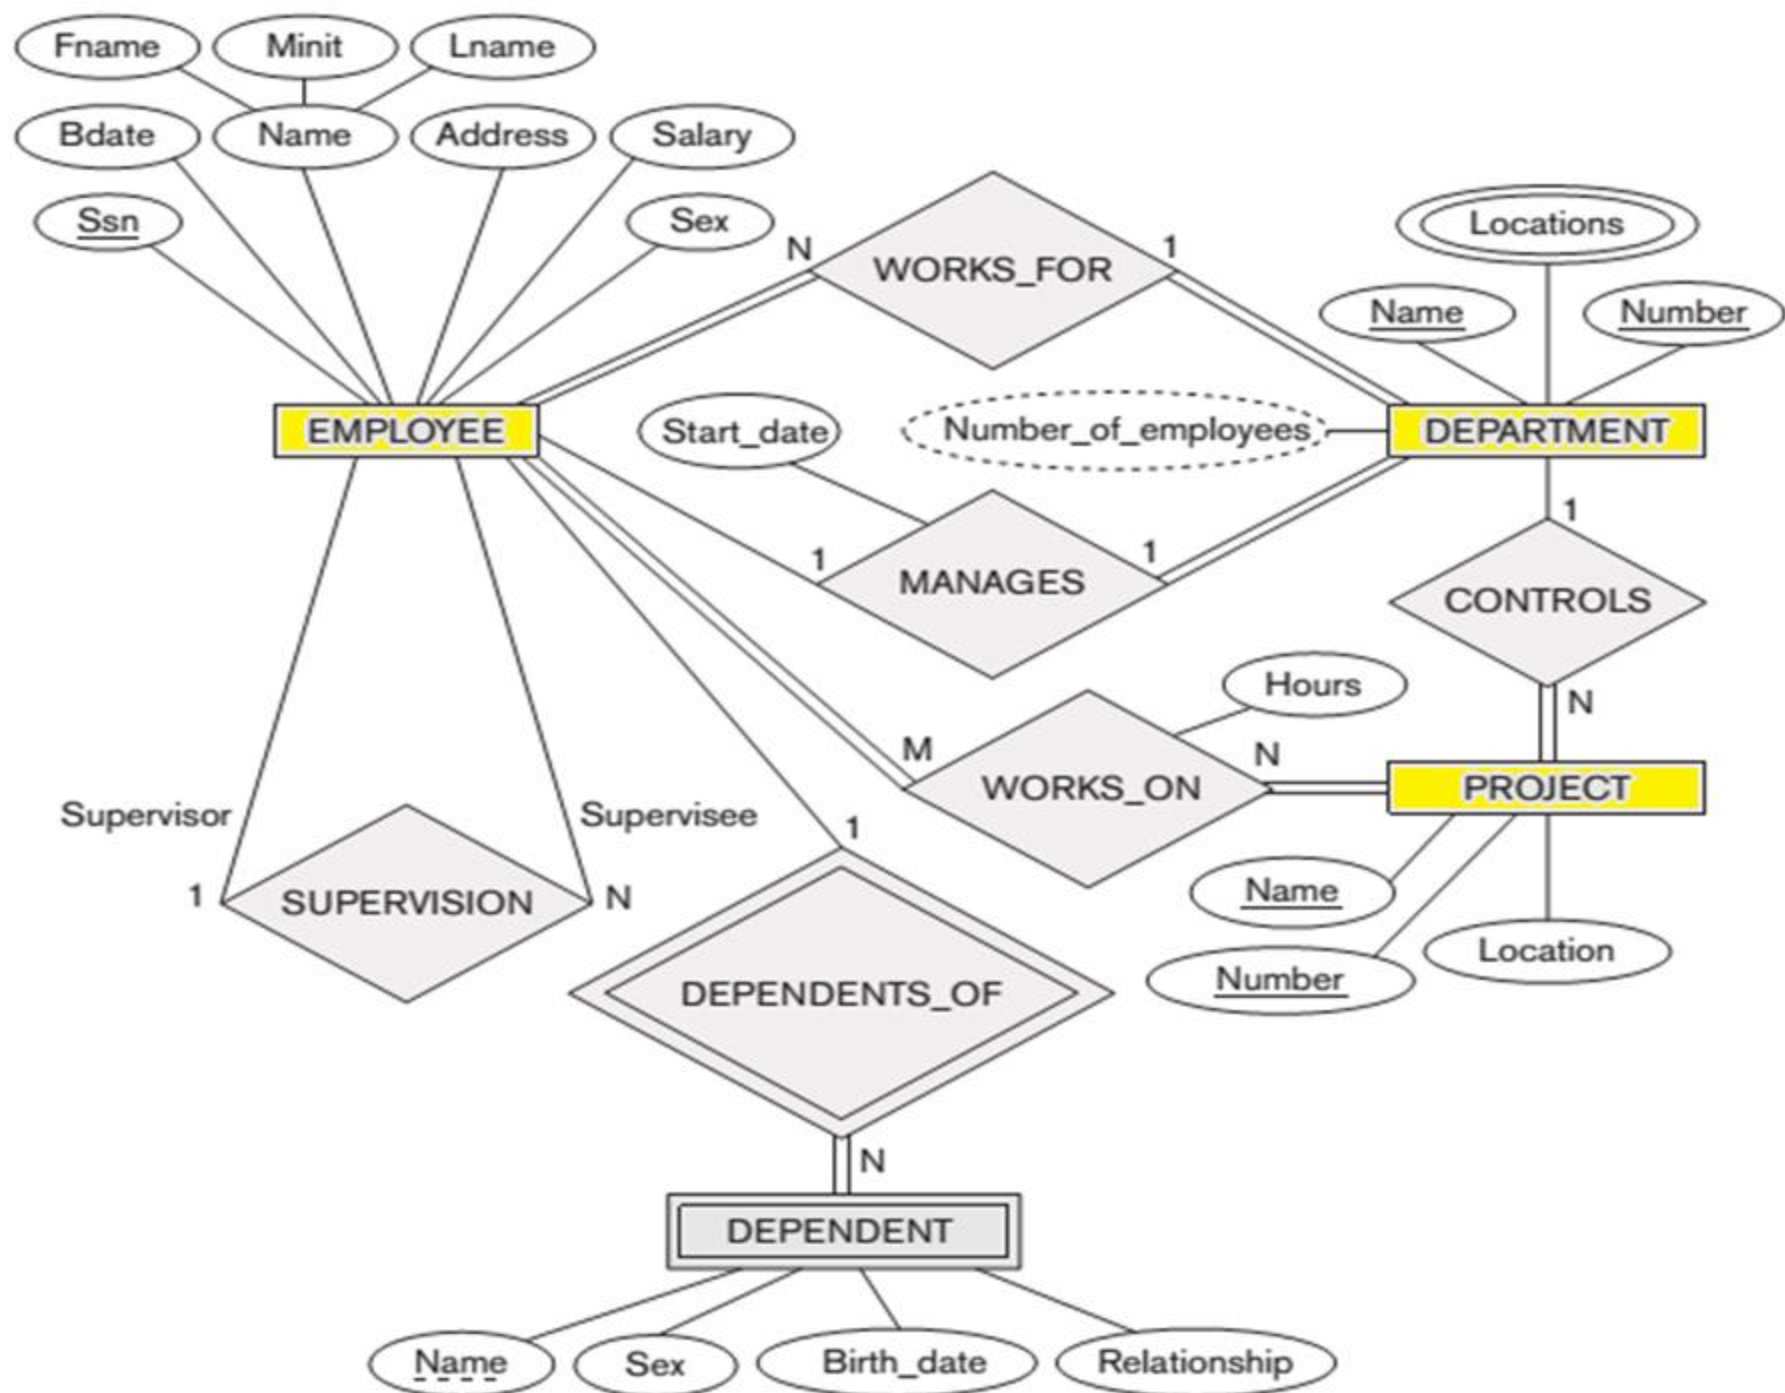

- ▶ Step 8: Options for Mapping Specialization or Generalization.
- ▶ Step 9: Mapping of Union Types (Categories)

ER-to-Relational Mapping - Step 1: Mapping of Regular Entity Types

▶ **Step 1: Mapping of Regular (strong) Entity Types**

- ▶ Entity → Relation
- ▶ Simple attribute → Attribute of relation
- ▶ Composite attribute → Set of simple component attributes
- ▶ One of the key attribute of entity → Primary key of relation

- ▶ **Example:** We create the relations EMPLOYEE, DEPARTMENT, and PROJECT in the relational schema corresponding to the regular entities in the ER diagram. SSN, DNUMBER, and PNUMBER are the primary keys for the relations EMPLOYEE, DEPARTMENT, and PROJECT as shown.

ER-to-Relational Mapping - Step 1: Mapping of Regular Entity Types

EMPLOYEE

FNAME	MINIT	LNAME	<u>SSN</u>	BDATE	ADDRESS	SEX	SALARY
-------	-------	-------	------------	-------	---------	-----	--------

DEPARTMENT

DNAME	<u>DNUMBER</u>
-------	----------------

PROJECT

PNAME	<u>PNUMBER</u>	PLOCATION
-------	----------------	-----------

ER- & EER-to-Relational Mapping

▶ ER-

- ▶ Step 1: Mapping of Regular Entity Types
- ▶ **Step 2: Mapping of Weak Entity Types**
- ▶ Step 3: Mapping of Binary 1:1 Relationship Types
- ▶ Step 4: Mapping of Binary 1:N Relationship Types
- ▶ Step 5: Mapping of Binary M:N Relationship Types
- ▶ Step 6: Mapping of Multivalued attributes
- ▶ Step 7: Mapping of N-ary Relationship Types

▶ EER-

- ▶ Step 8: Options for Mapping Specialization or Generalization.
- ▶ Step 9: Mapping of Union Types (Categories)

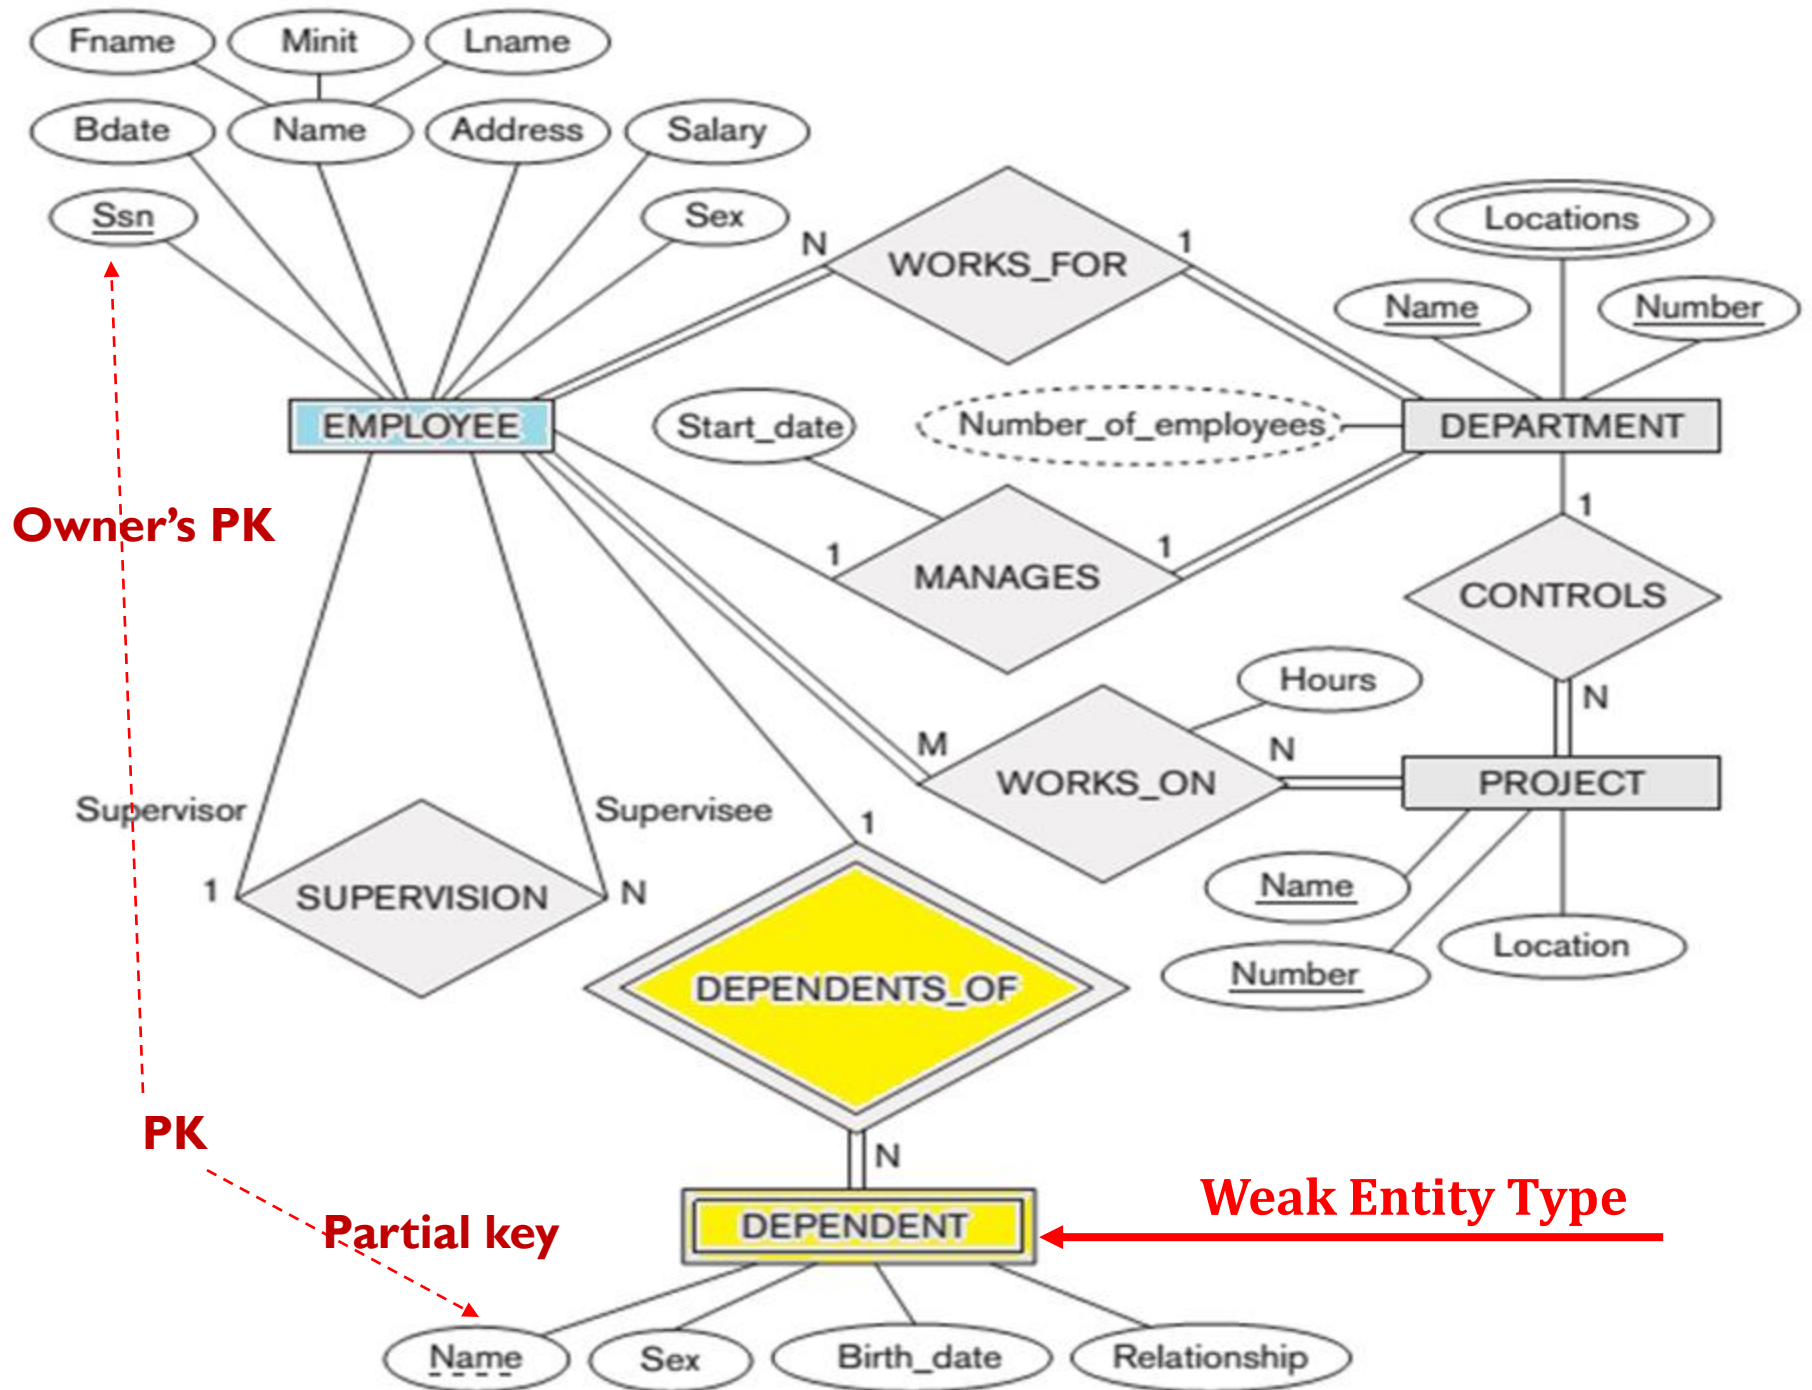

ER-to-Relational Mapping - Step 2: Mapping of Weak Entity Types

► Step 2: Mapping of Weak Entity Types

- For each weak entity type W in the ER schema with owner entity type E, create a relation R and include all simple attributes (or simple components of composite attributes) of W as attributes of R
- In addition, include as foreign key attributes of R the primary key attribute(s) of the relation(s) that correspond to the owner entity type(s)
- The primary key of R is the *combination* of the primary key(s) of the owner(s) and the partial key of the weak entity type W, if any
- **Example:** Create the relation DEPENDENT in this step to correspond to the weak entity type DEPENDENT. Include the primary key SSN of the EMPLOYEE relation as a foreign key attribute of DEPENDENT (renamed to ESSN)

The primary key of the DEPENDENT relation is the combination {ESSN, DEPENDENT_NAME} because DEPENDENT_NAME is the partial key of DEPENDENT

- Note: CASCADE option as implemented

ER-to-Relational Mapping - Step 2: Mapping of Weak Entity Types

EMPLOYEE

FNAME	MINIT	LNAME	<u>SSN</u>	BDATE	ADDRESS	SEX	SALARY
-------	-------	-------	------------	-------	---------	-----	--------

DEPARTMENT

DNAME	<u>DNUMBER</u>
-------	----------------

PROJECT

PNAME	<u>PNUMBER</u>	PLOCATION
-------	----------------	-----------

DEPENDENT

<u>ESSN</u>	<u>DEPENDENT_NAME</u>	SEX	BDATE	RELATIONSHIP
-------------	-----------------------	-----	-------	--------------

ER-to-Relational Mapping

- ▶ ER-
 - ▶ Step 1: Mapping of Regular Entity Types
 - ▶ Step 2: Mapping of Weak Entity Types
 - ▶ **Step 3: Mapping of Binary 1:1 Relationship Types**
 - ▶ Step 4: Mapping of Binary 1:N Relationship Types
 - ▶ Step 5: Mapping of Binary M:N Relationship Types
 - ▶ Step 6: Mapping of Multivalued attributes
 - ▶ Step 7: Mapping of N-ary Relationship Types
- ▶ Transformation of binary relationships - depends on *functionality* of relationship and *membership class* of participating entity types

ER-to-Relational Mapping – Step 3: Mapping of Binary 1:1 Relationship Types

- ▶ Identify relations that correspond to entity types E1 and E2 participating in R.
- ▶ Possible approaches:
 - ▶ Foreign key approach
 - ▶ Merged relationship approach
 - ▶ Cross-reference or relationship relation approach

ER-to-Relational Mapping – Step 3: Mapping of Binary 1:1 Relationship Types

► Possible approaches:

► Foreign key approach

- Choose $E1$ and include primary key of $E2$ as foreign key in $E1$.
 - Include simple attributes of 1:1 relationship type as attributes of $E1$.
- ***$E1$ is a mandatory (or almost mandatory) member of an $N:1$ relationship with $E2$.***

EMPLOYEE (SSN, FNAME, LNAME, ADDRESS,...)

DEPARTMENT (DNAME, DNUMBER, MANAGER_SSN, MANAGER_START_DATE)

- If the membership class for $E1$ and $E2$ are both mandatory, a foreign key can be used in either relation.

ER-to-Relational Mapping – Step 3: Mapping of Binary 1:1 Relationship Types

- ▶ Possible approaches:
 - ▶ Merged relationship approach
 - ▶ Merge E1, E2, R into a single relation
 - *Possible when both participations are mandatory.*

- ▶ EMPLOYEE_TAX (SSN, FNAME, LNAME, ADDRESS,... TAXID,...)
OR
- ▶ EMPLOYEE_TAX (SSN, FNAME, LNAME, ADDRESS,... TAXID,...)

ER-to-Relational Mapping – Step 3: Mapping of Binary 1:1 Relationship Types

- ▶ Possible approaches:
 - ▶ Cross-reference or relationship relation approach:
 - ▶ Create a new relation R
 - ▶ Include primary key of participating entity types as foreign key attributes in R
 - ▶ Include any simple attributes of 1:1 relationship type
 - ▶ The primary key of either entity type will be the key of R

EMPLOYEE (SSN, FNAME, LNAME, ADDRESS,...)

MANAGES (SSN, DNUMBER, START_DATE)

DEPARTMENT (DNAME, DNUMBER, ...)

ER-to-Relational Mapping

▶ ER-

- ▶ Step 1: Mapping of Regular Entity Types
- ▶ Step 2: Mapping of Weak Entity Types
- ▶ Step 3: Mapping of Binary 1:1 Relationship Types
- ▶ **Step 4: Mapping of Binary 1:N Relationship Types**
- ▶ Step 5: Mapping of Binary M:N Relationship Types
- ▶ Step 6: Mapping of Multivalued attributes
- ▶ Step 7: Mapping of N-ary Relationship Types
- ▶ Transformation of binary relationships - depends on *functionality* of relationship and *membership class* of participating entity types

ER-to-Relational Mapping - Step 4: Mapping of Binary 1:N Relationship Types

- ▶ For each regular binary 1:N relationship type:
 - ▶ Identify relation $E2$ that represents participating entity type at N -side of relationship type
 - ▶ Include primary key of other entity type as foreign key in $E2$
 - ▶ Include simple attributes of 1:N relationship type as attributes of $E2$
- *$E2$ is a mandatory (or almost mandatory) member of an $N:1$ relationship with $E1$*

EMPLOYEE (SSN, FNAME, LNAME, ADDRESS,..., DNO)

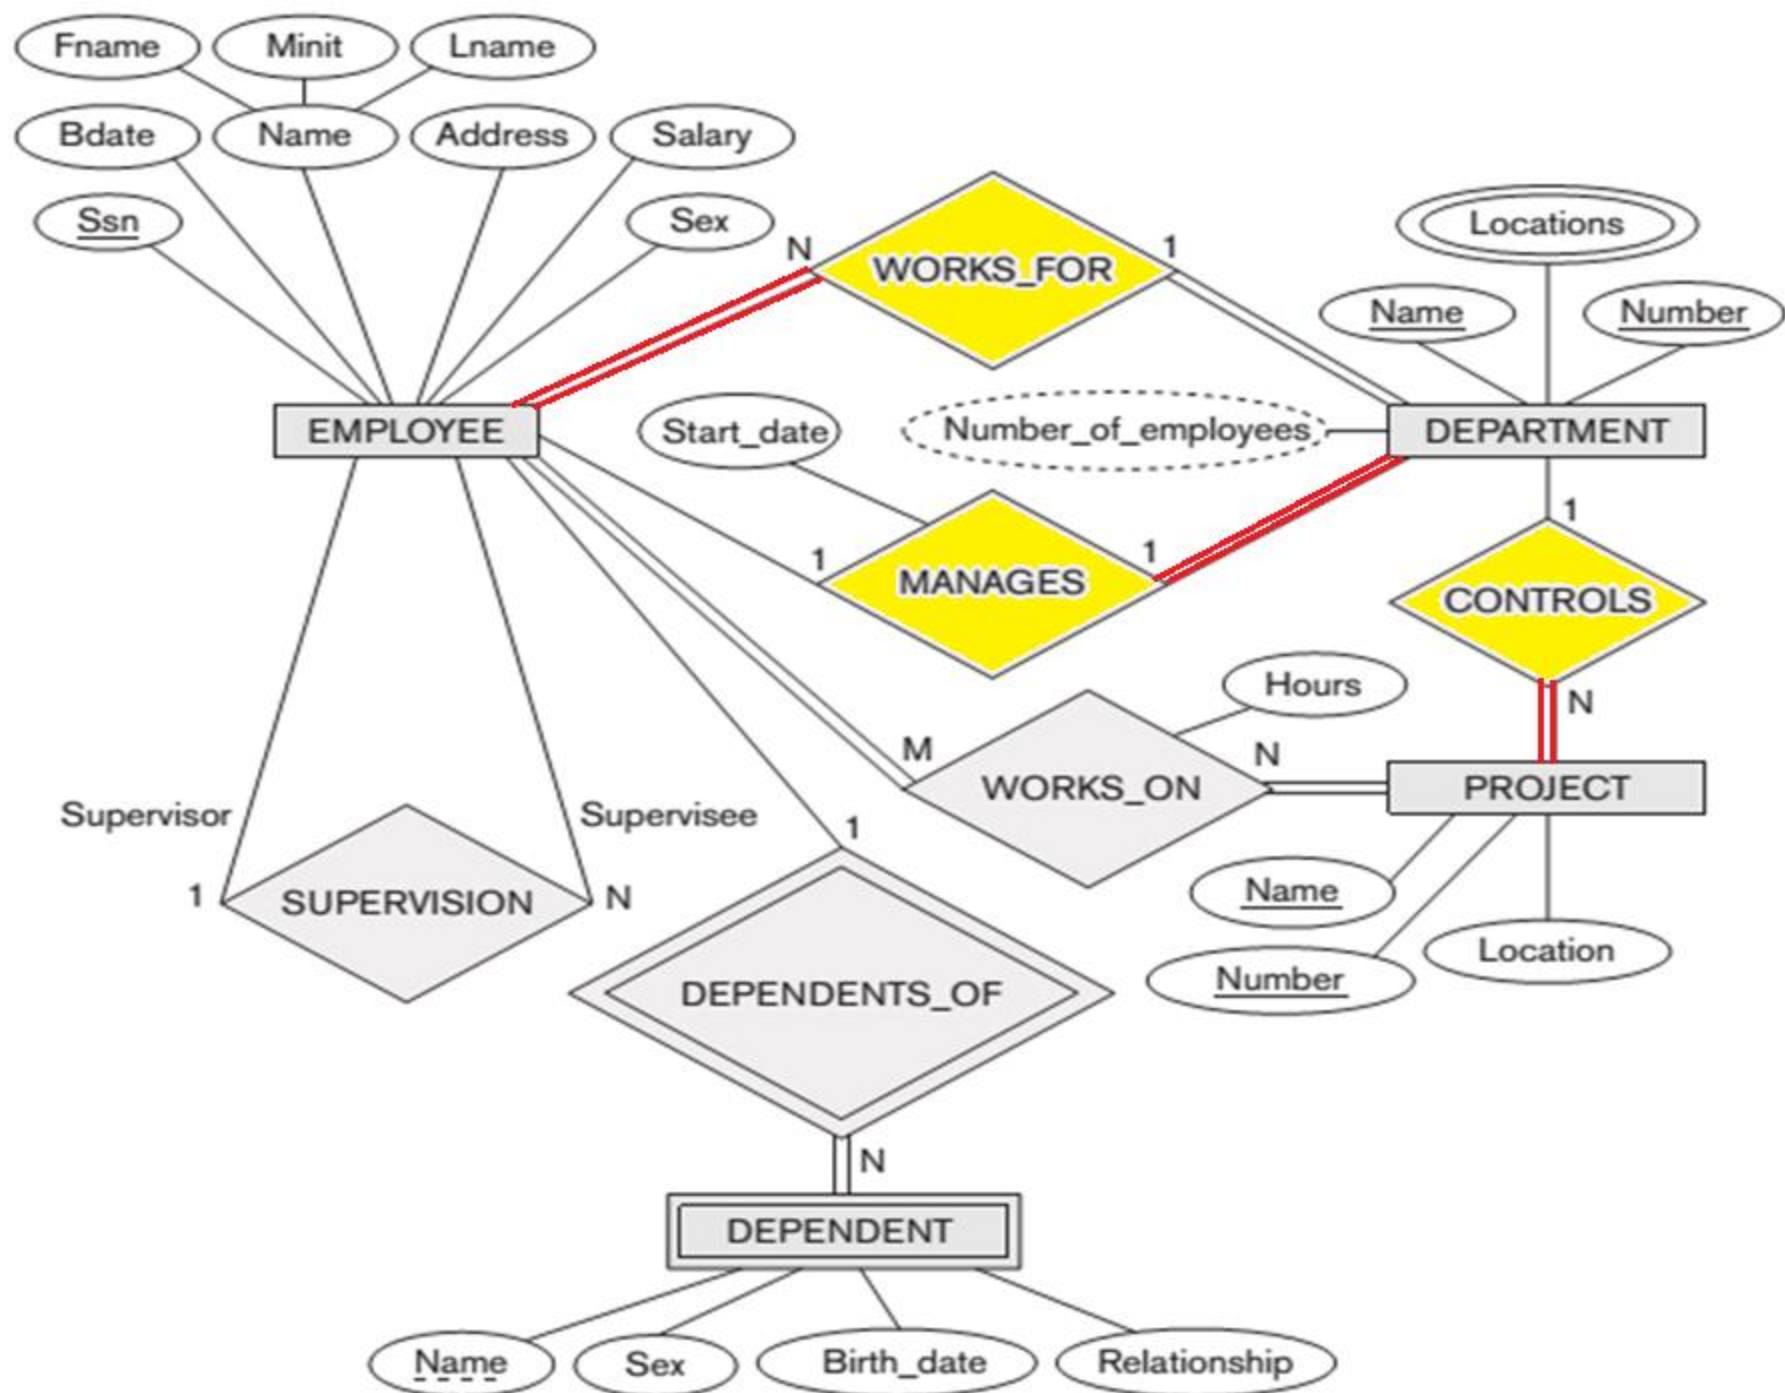

DEPARTMENT (DNAME, DNUMBER, ...)

ER-to-Relational Mapping - Step 4: Mapping of Binary 1:N Relationship Types

- ▶ Alternative approach
 - ▶ Use the **relationship relation** (cross-reference) option as in the third option for binary 1:1 relationships.
 - ▶ *N-side of the relationship is optional.*

- ▶ One possible representation of the relationship:
BORROWER(BNUMBER, NAME, ADDRESS, ...)
BOOK(ISBN, TITLE, ..., **BNUMBER**)
- ▶ A better alternative:
BORROWER(BNUMBER, NAME, ADDRESS, ...)
BOOK(ISBN, TITLE, ...)
ON_LOAN(ISBN, BNUMBER)

ER-to-Relational Mapping - Step 3-4: Mapping of Relationship Types

EMPLOYEE

FNAME	MINIT	LNAME	<u>SSN</u>	BDATE	ADDRESS	SEX	SALARY		DNO
-------	-------	-------	------------	-------	---------	-----	--------	--	-----

DEPARTMENT

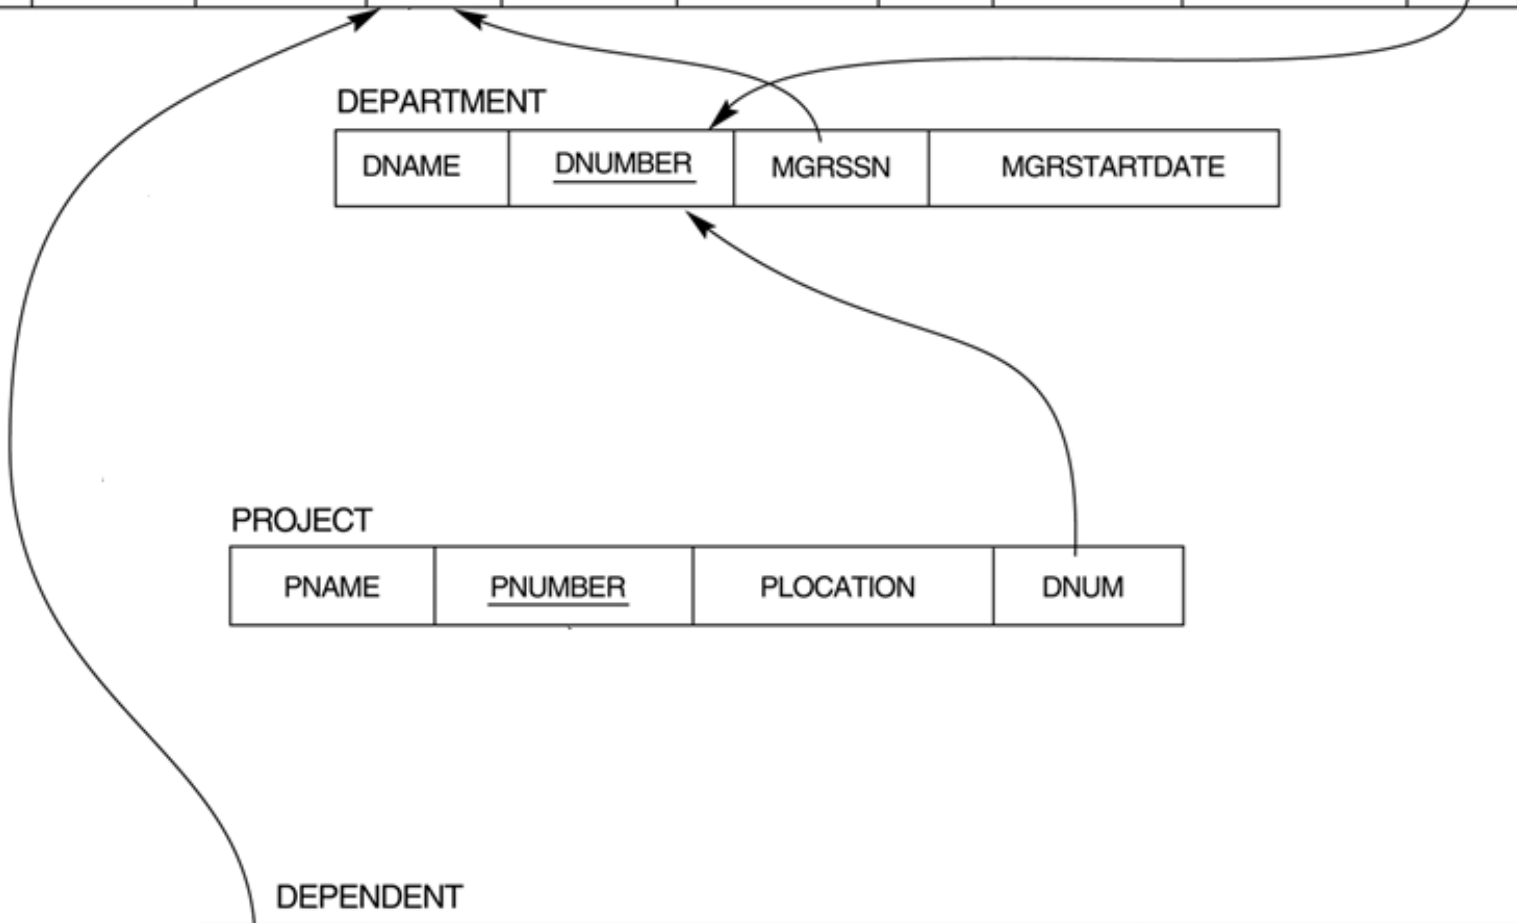

DNAME	<u>DNUMBER</u>	MGRSSN	MGRSTARTDATE
-------	----------------	--------	--------------

PROJECT

PNAME	<u>PNUMBER</u>	PLOCATION	DNUM
-------	----------------	-----------	------

DEPENDENT

<u>ESSN</u>	<u>DEPENDENT_NAME</u>	SEX	BDATE	RELATIONSHIP
-------------	-----------------------	-----	-------	--------------

ER-to-Relational Mapping

▶ ER-

- ▶ Step 1: Mapping of Regular Entity Types
- ▶ Step 2: Mapping of Weak Entity Types
- ▶ Step 3: Mapping of Binary 1:1 Relationship Types
- ▶ Step 4: Mapping of Binary 1:N Relationship Types
- ▶ **Step 5: Mapping of Binary M:N Relationship Types**
- ▶ Step 6: Mapping of Multivalued attributes
- ▶ Step 7: Mapping of N-ary Relationship Types
- ▶ Transformation of binary relationships - depends on *functionality* of relationship and *membership class* of participating entity types

ER-to-Relational Mapping - Step 5: Mapping of Binary M:N Relationship Types

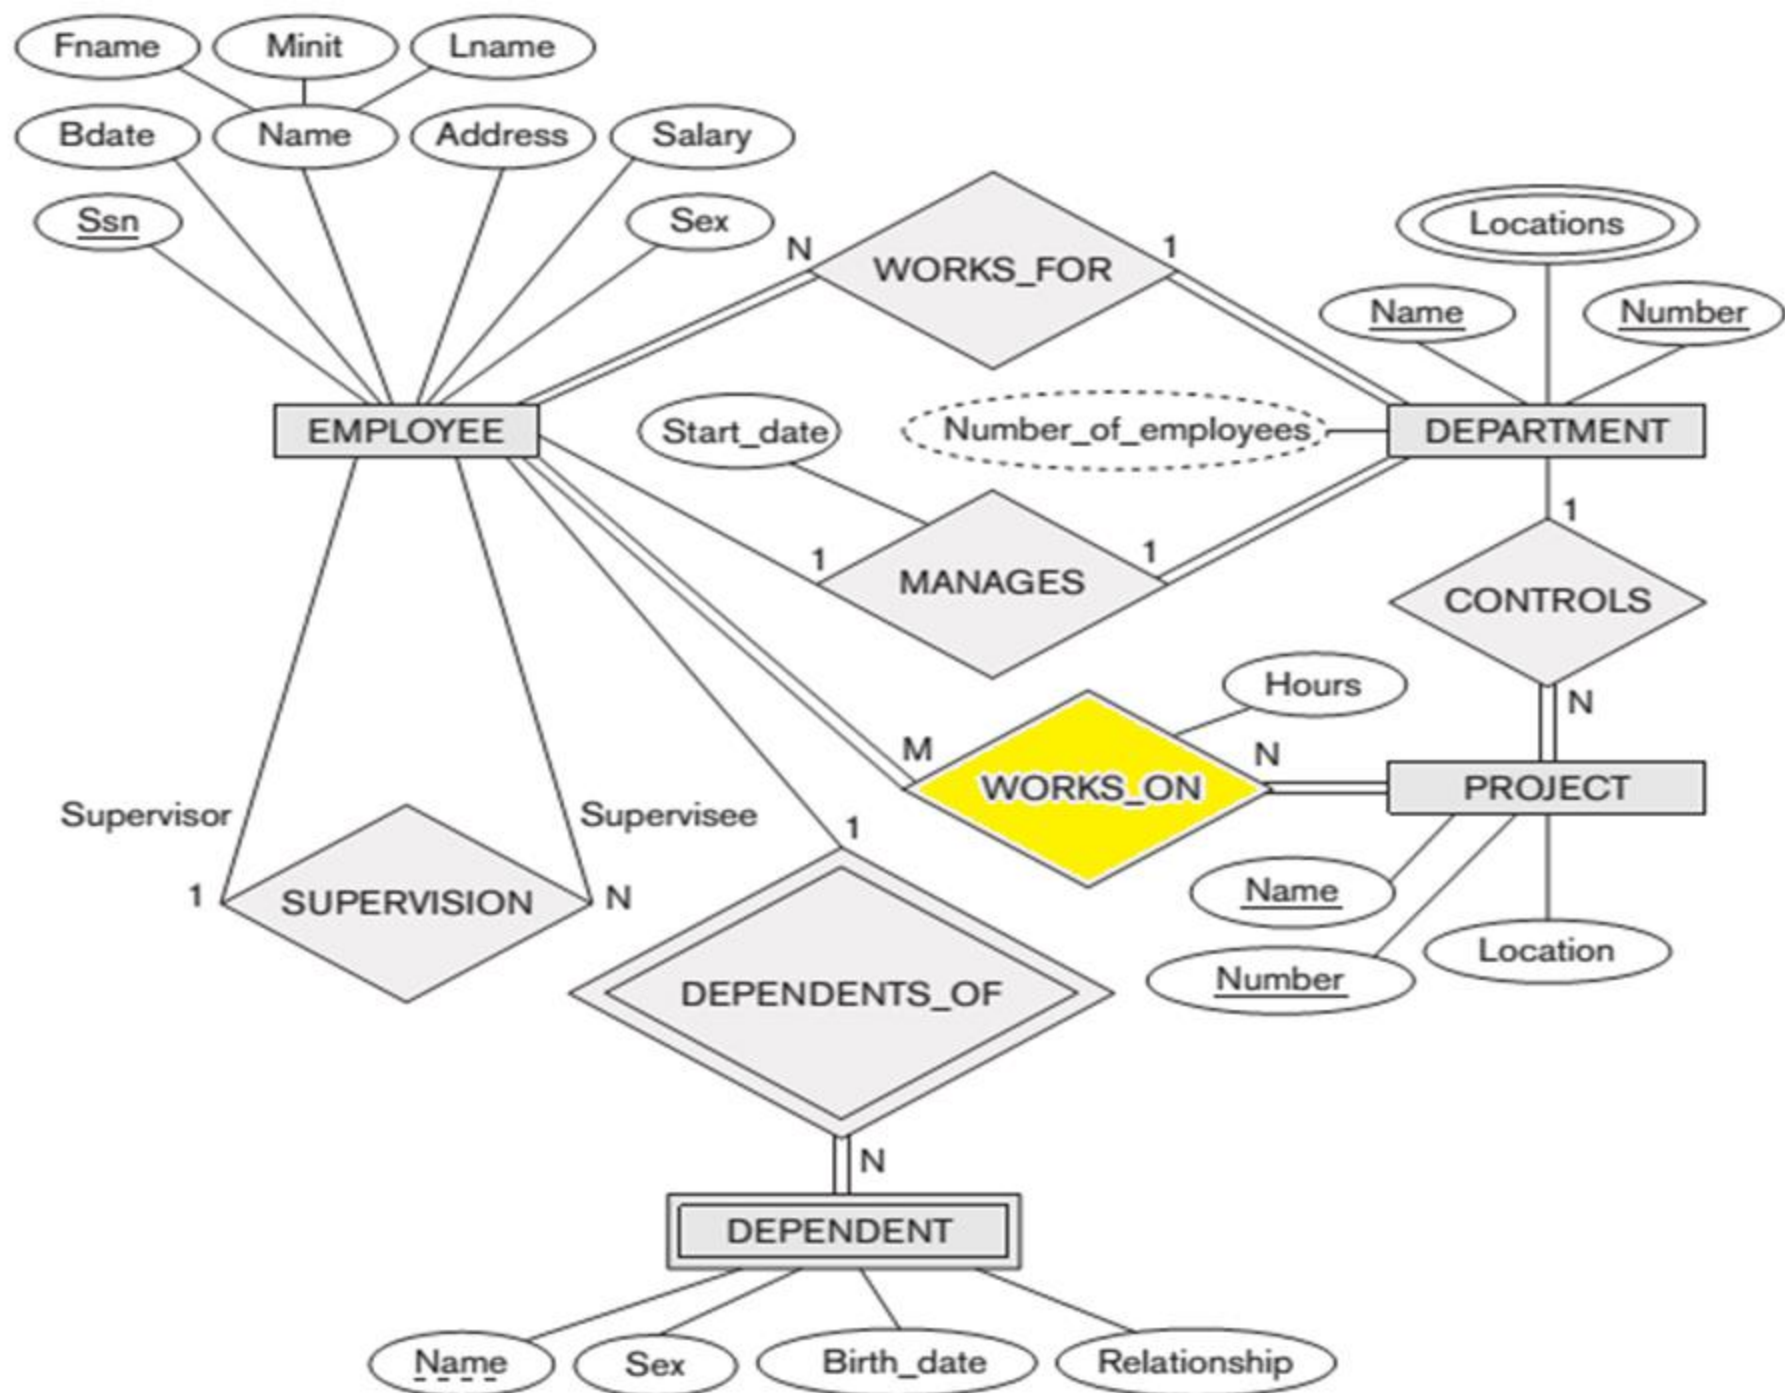

- ▶ N:M binary relationships:
 - ▶ Create a new relation R
 - ▶ Include primary key of participating entity types as foreign key attributes in R
 - ▶ Include any simple attributes of $M:N$ relationship type
 - ▶ The combination of the primary keys of all participating entity types will form the primary key of the new relation.

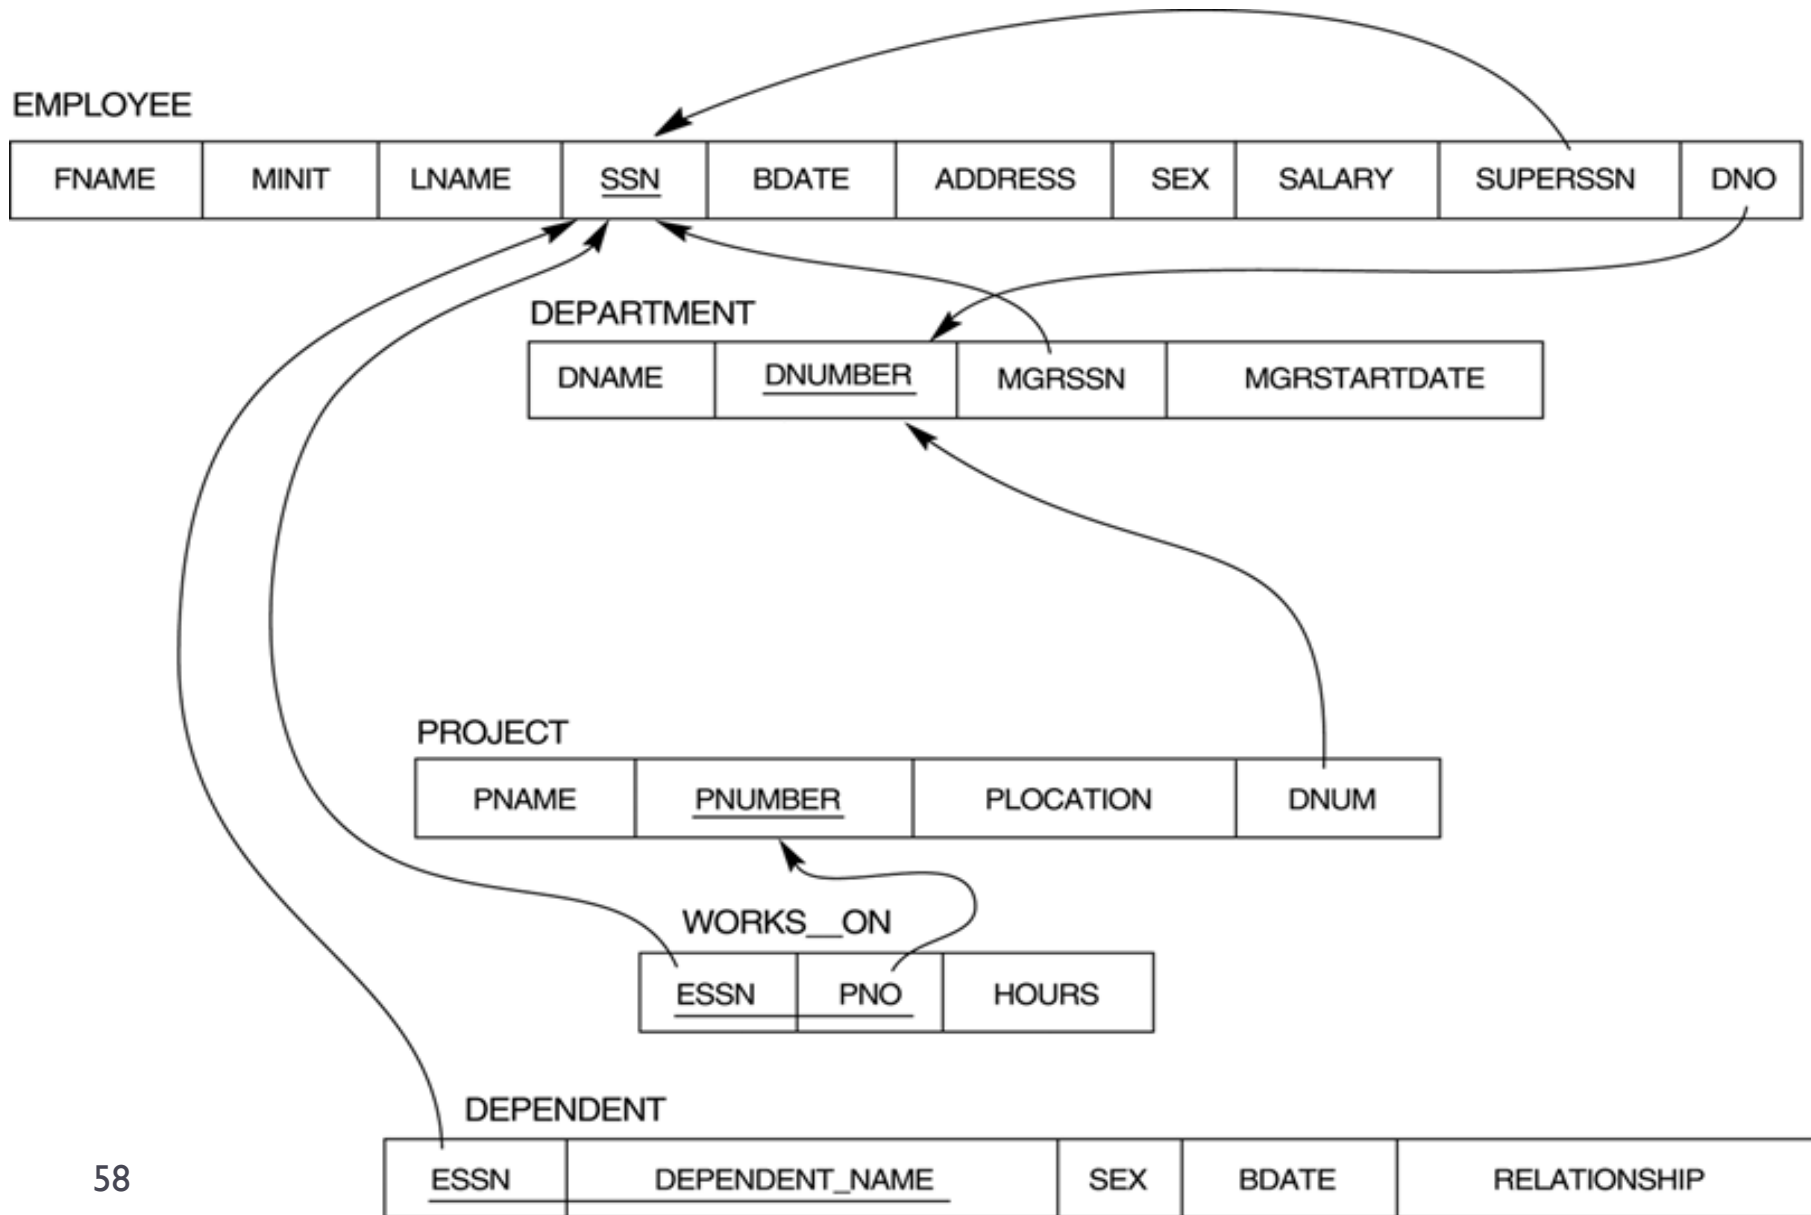

STUDENT (NUMBER, NAME, ADDRESS,...)

ENROL(SNUMBER, MDL-NUMBER, DATE)

MODULE (NUMBER, TITLE,...)

Step 5: Mapping M:N Relationship Types

ER-to-Relational Mapping - Transformation of recursive relationship type

- ▶ Transformation of recursive/involuted relationship type
 - ▶ Relationship type among different instances of the same entity
 - ▶ The name(s) of the primary key attribute(s) needs to be changed to reflect the role each entity plays in the relationship

ER-to-Relational Mapping - Transformation of recursive relationship type

- ▶ **Example 1:** 1:1 involuted relationship, in which the memberships for both entities are optional

PERSON(ID, NAME, ADDRESS, ...)

MARRY(HUSBAND-ID, WIFE_ID, DATE_OF_MARRIAGE)

ER-to-Relational Mapping - Transformation of recursive relationship type

- ▶ **Example 2:** 1:N involuted relationship
 - ▶ If the relationship is mandatory or almost mandatory:
`EMPLOYEE(ID, ENAME, ..., SUPERVISOR_ID)`
 - ▶ If the relationship is optional:
`EMPLOYEE(ID, ENAME, ...)`
`SUPERVISE(ID, START_DATE, ..., SUPERVISOR_ID)`

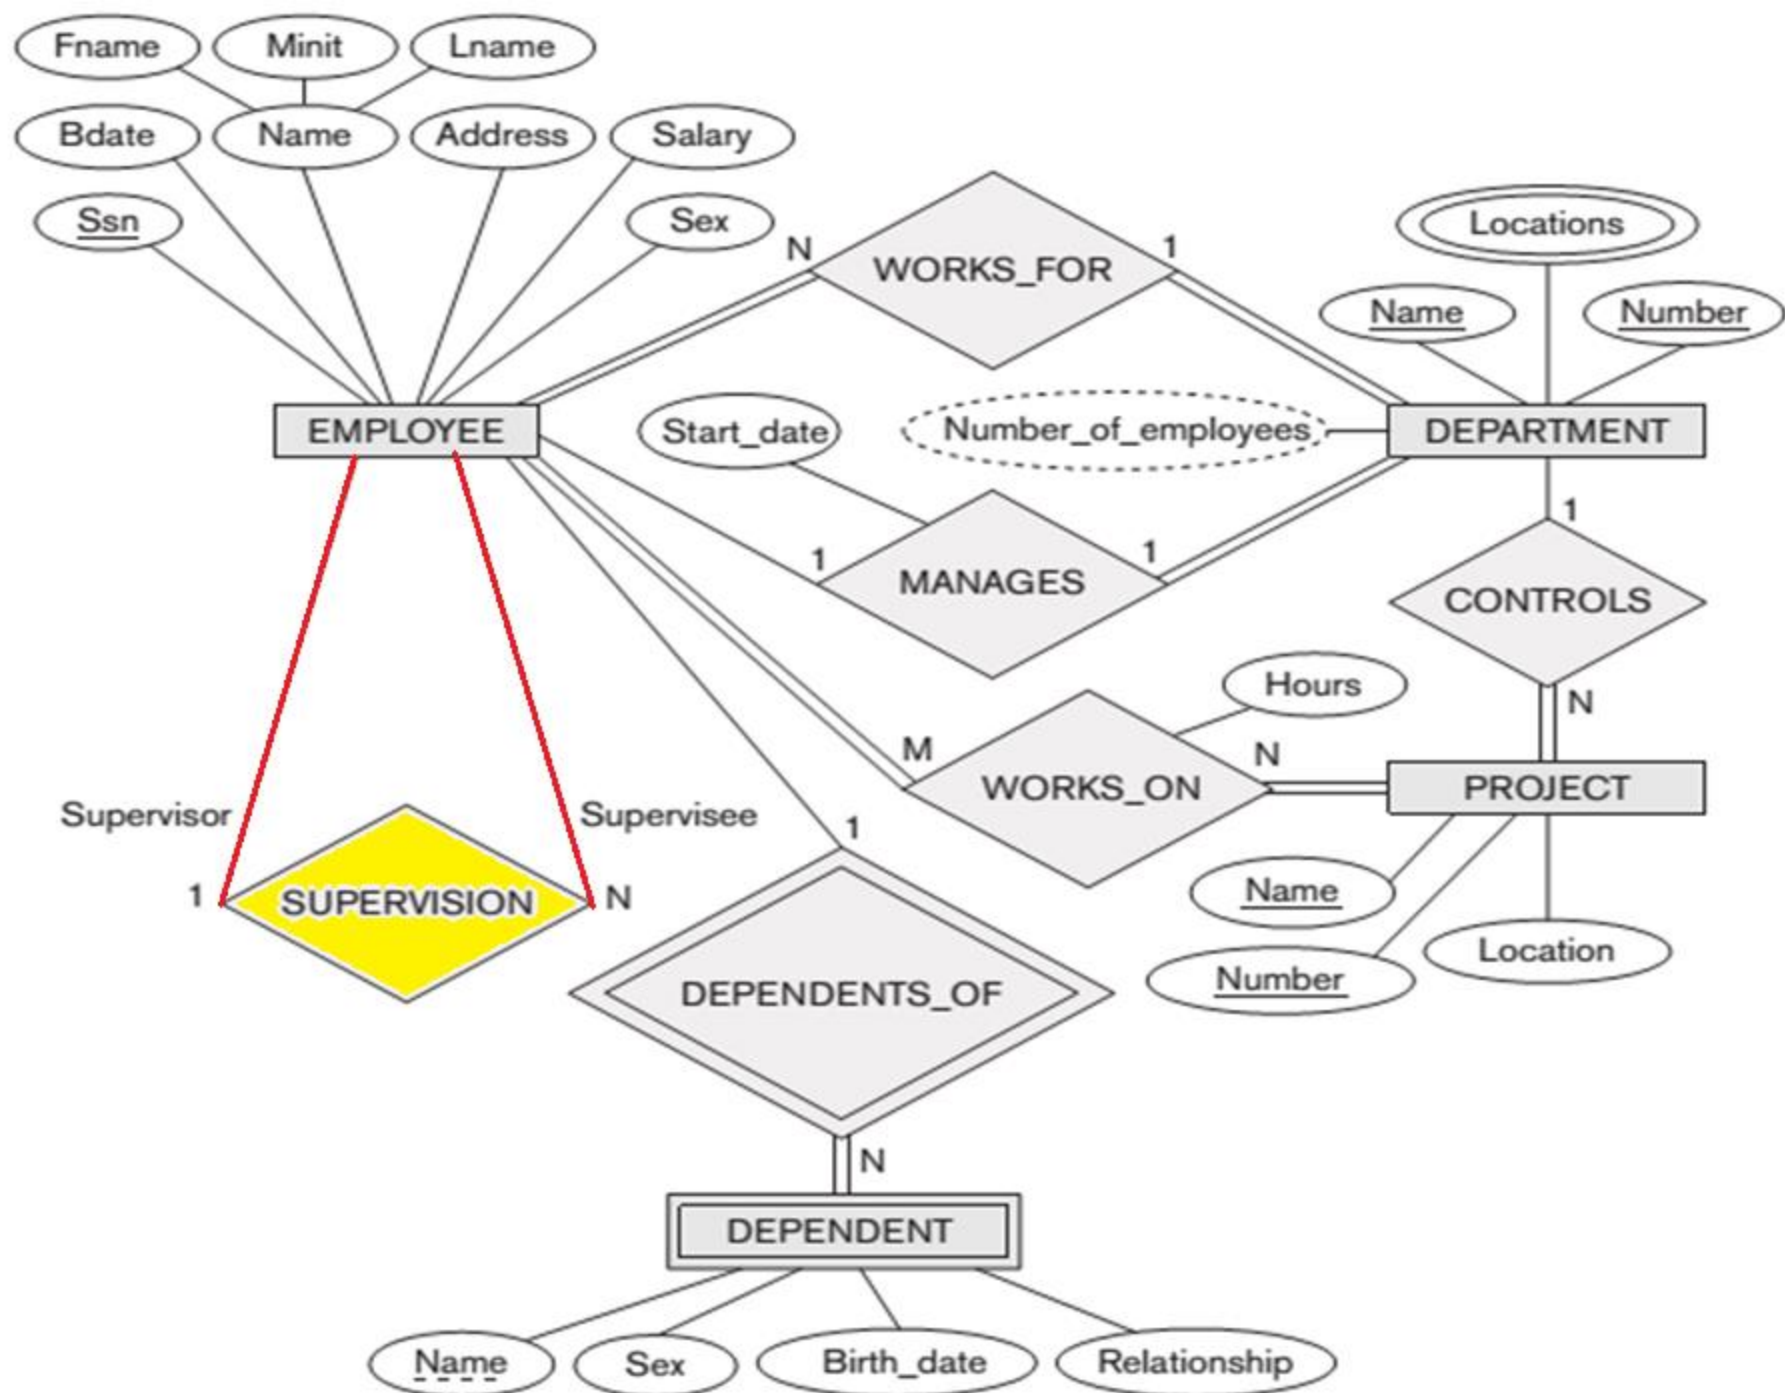

ER-to-Relational Mapping - Transformation of recursive relationship type

► **Example 3:** N:M involuted relationship

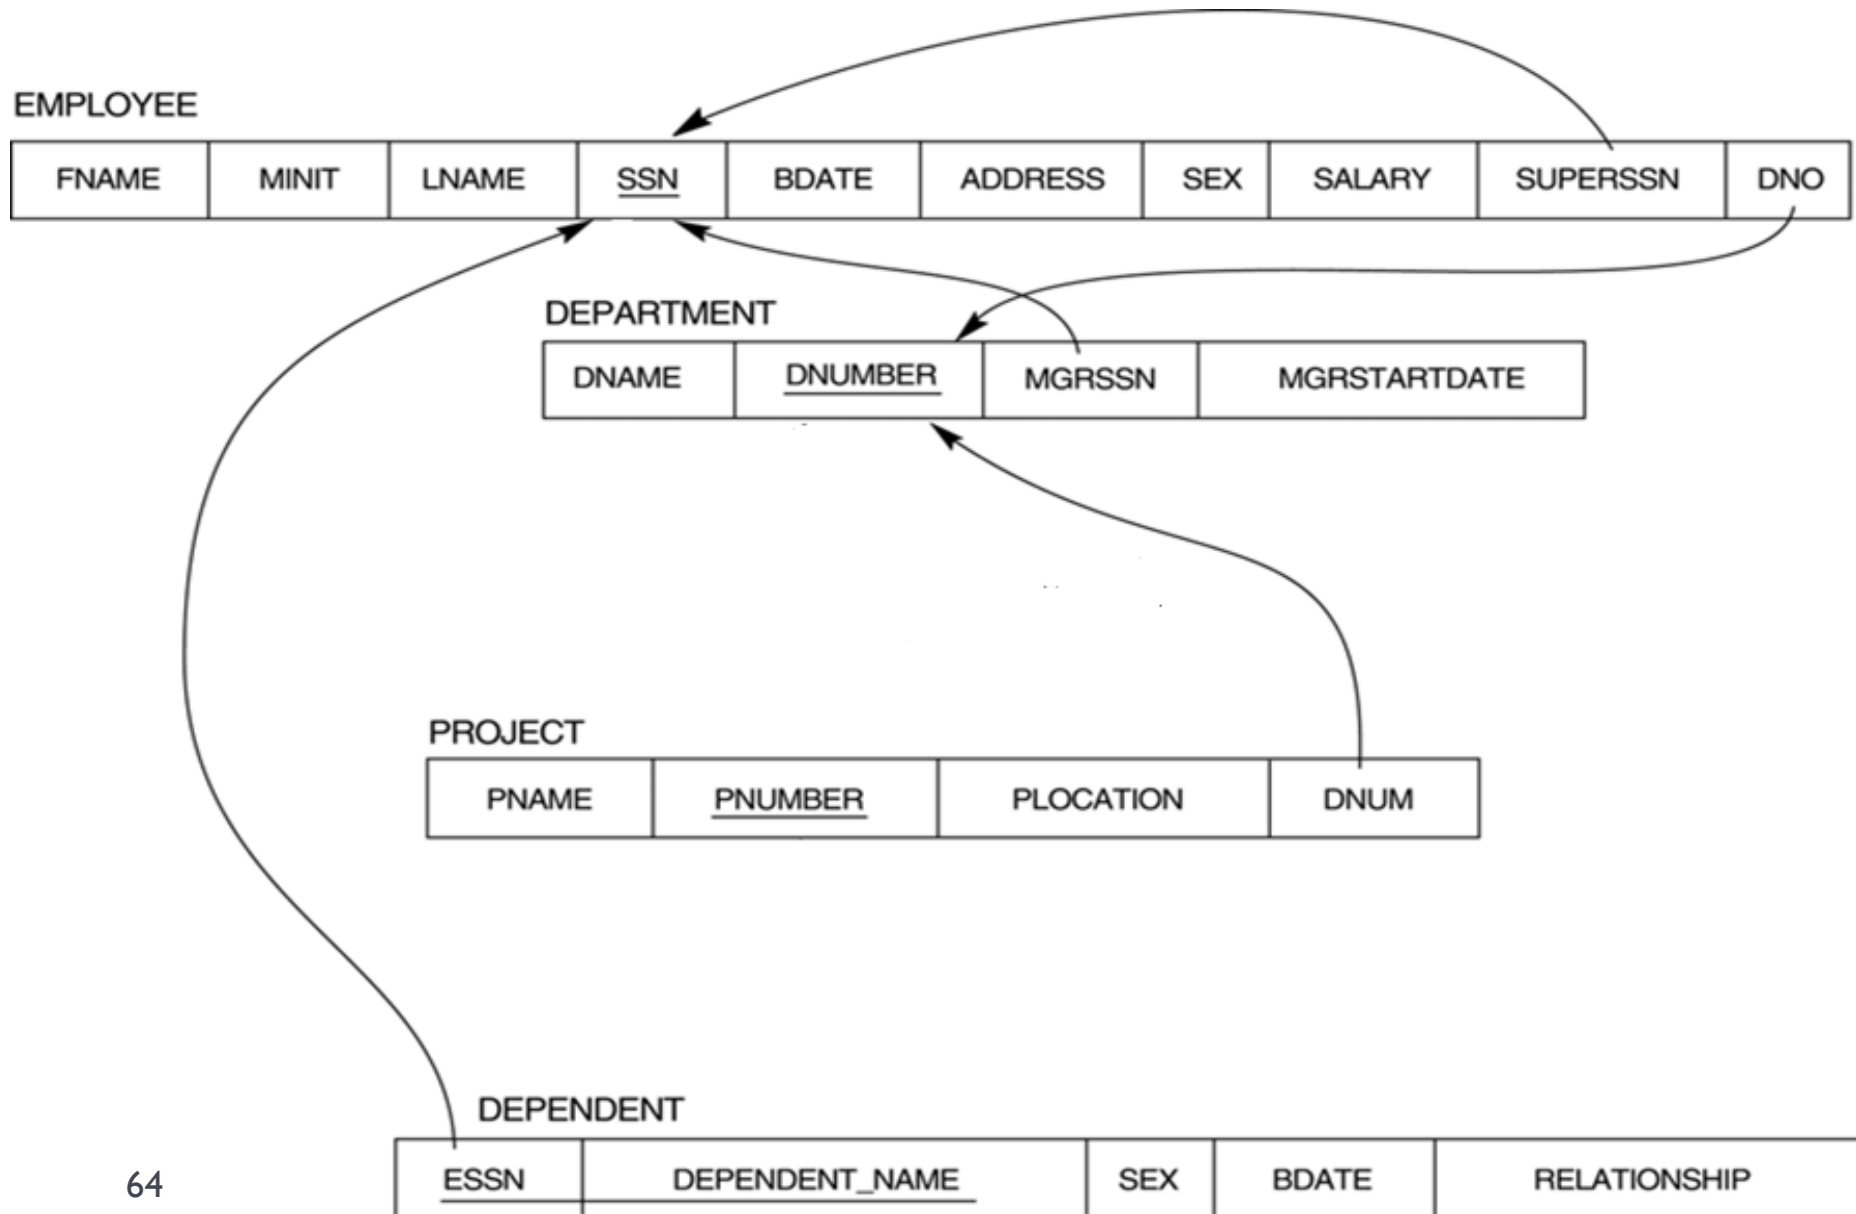

PART(PNUMBER, DESCRIPTION, ...)

COMPRISE(MAJOR-PNUMBER, MINOR-PNUMBER,
QUANTITY)

Transformation of recursive relationship type

ER-to-Relational Mapping

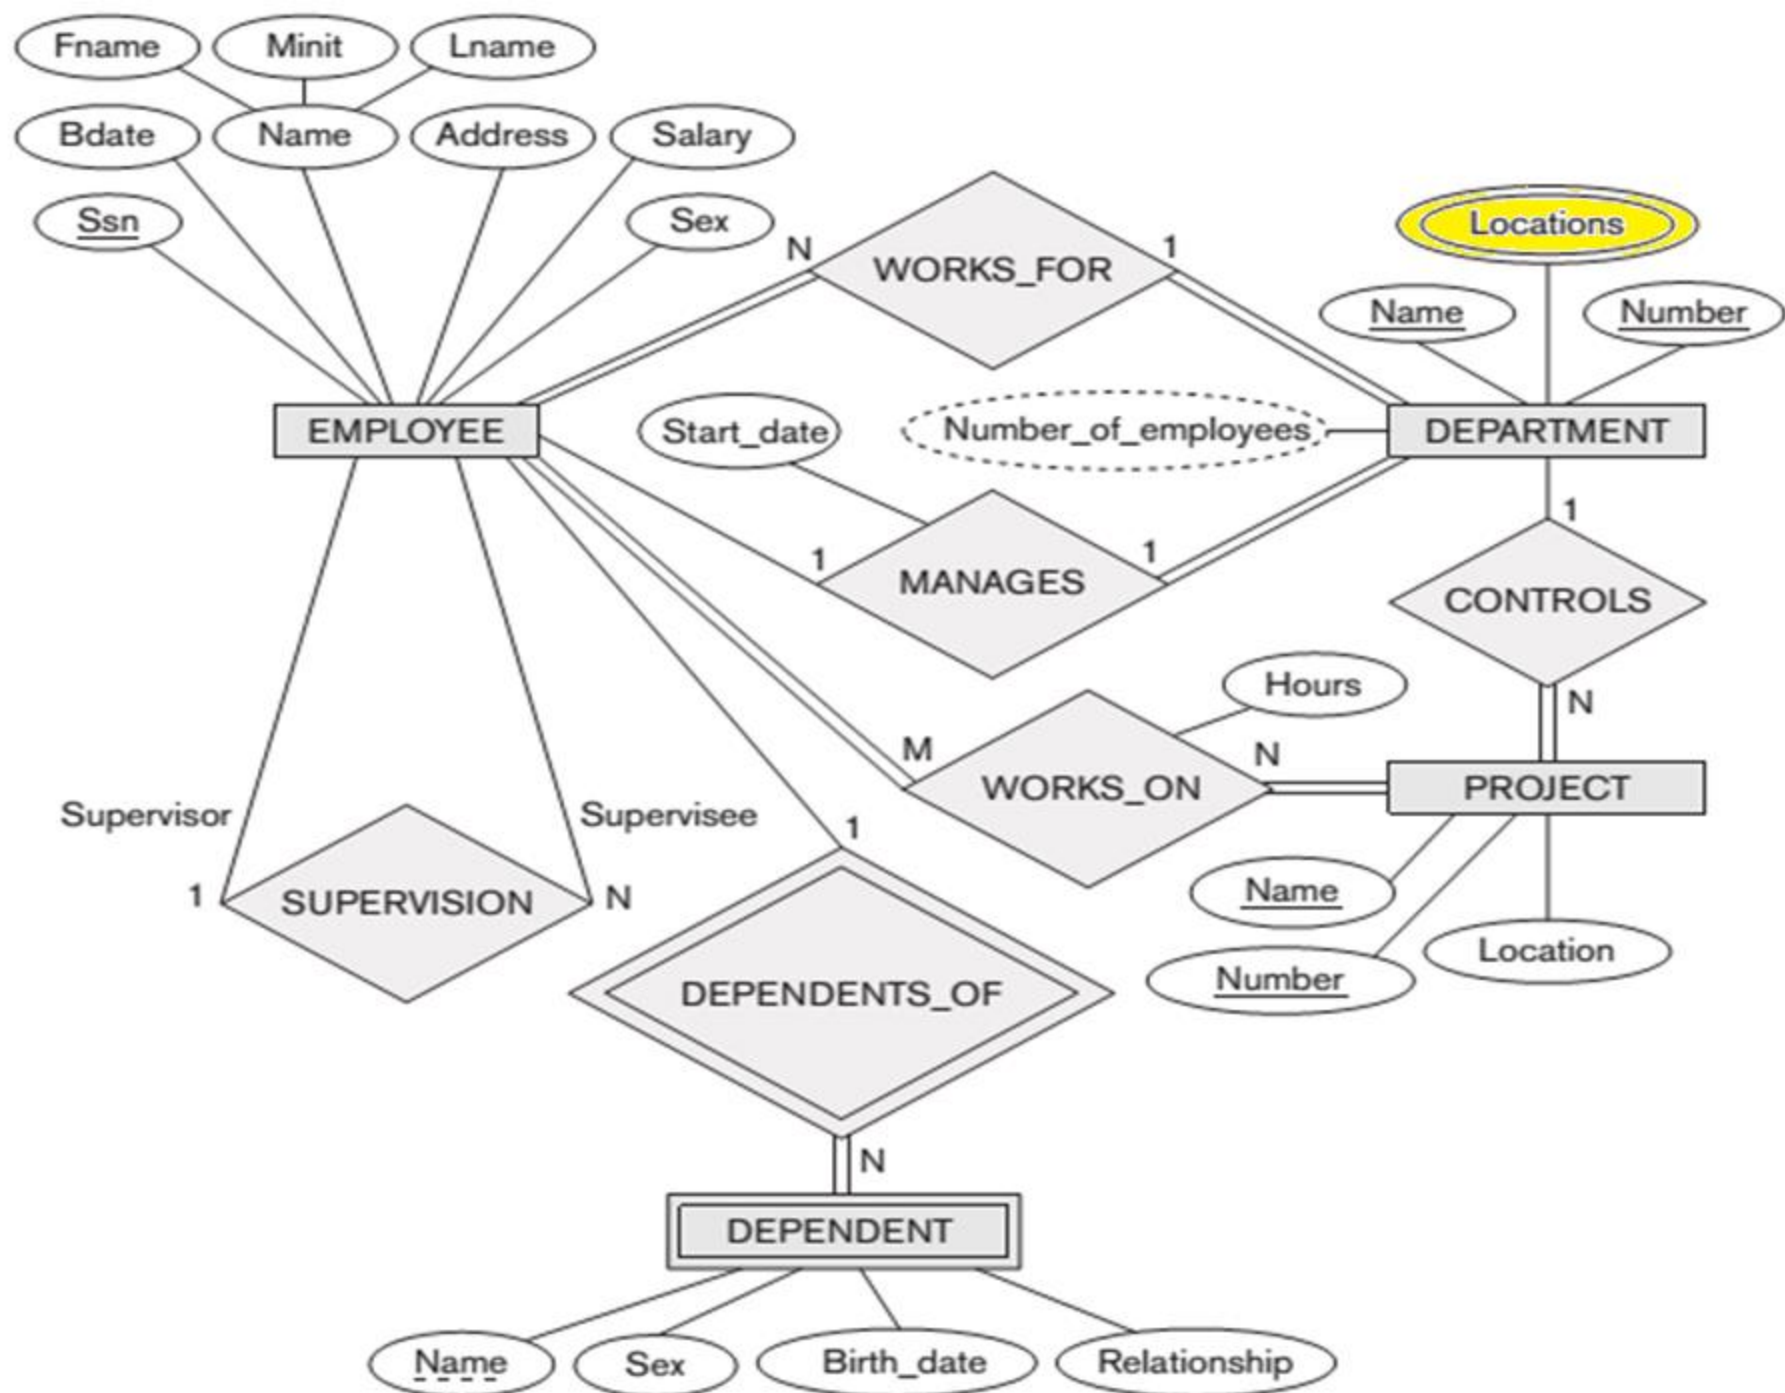

▶ ER-

- ▶ Step 1: Mapping of Regular Entity Types
- ▶ Step 2: Mapping of Weak Entity Types
- ▶ Step 3: Mapping of Binary 1:1 Relationship Types
- ▶ Step 4: Mapping of Binary 1:N Relationship Types
- ▶ Step 5: Mapping of Binary M:N Relationship Types
- ▶ **Step 6: Mapping of Multivalued attributes**
- ▶ Step 7: Mapping of N-ary Relationship Types

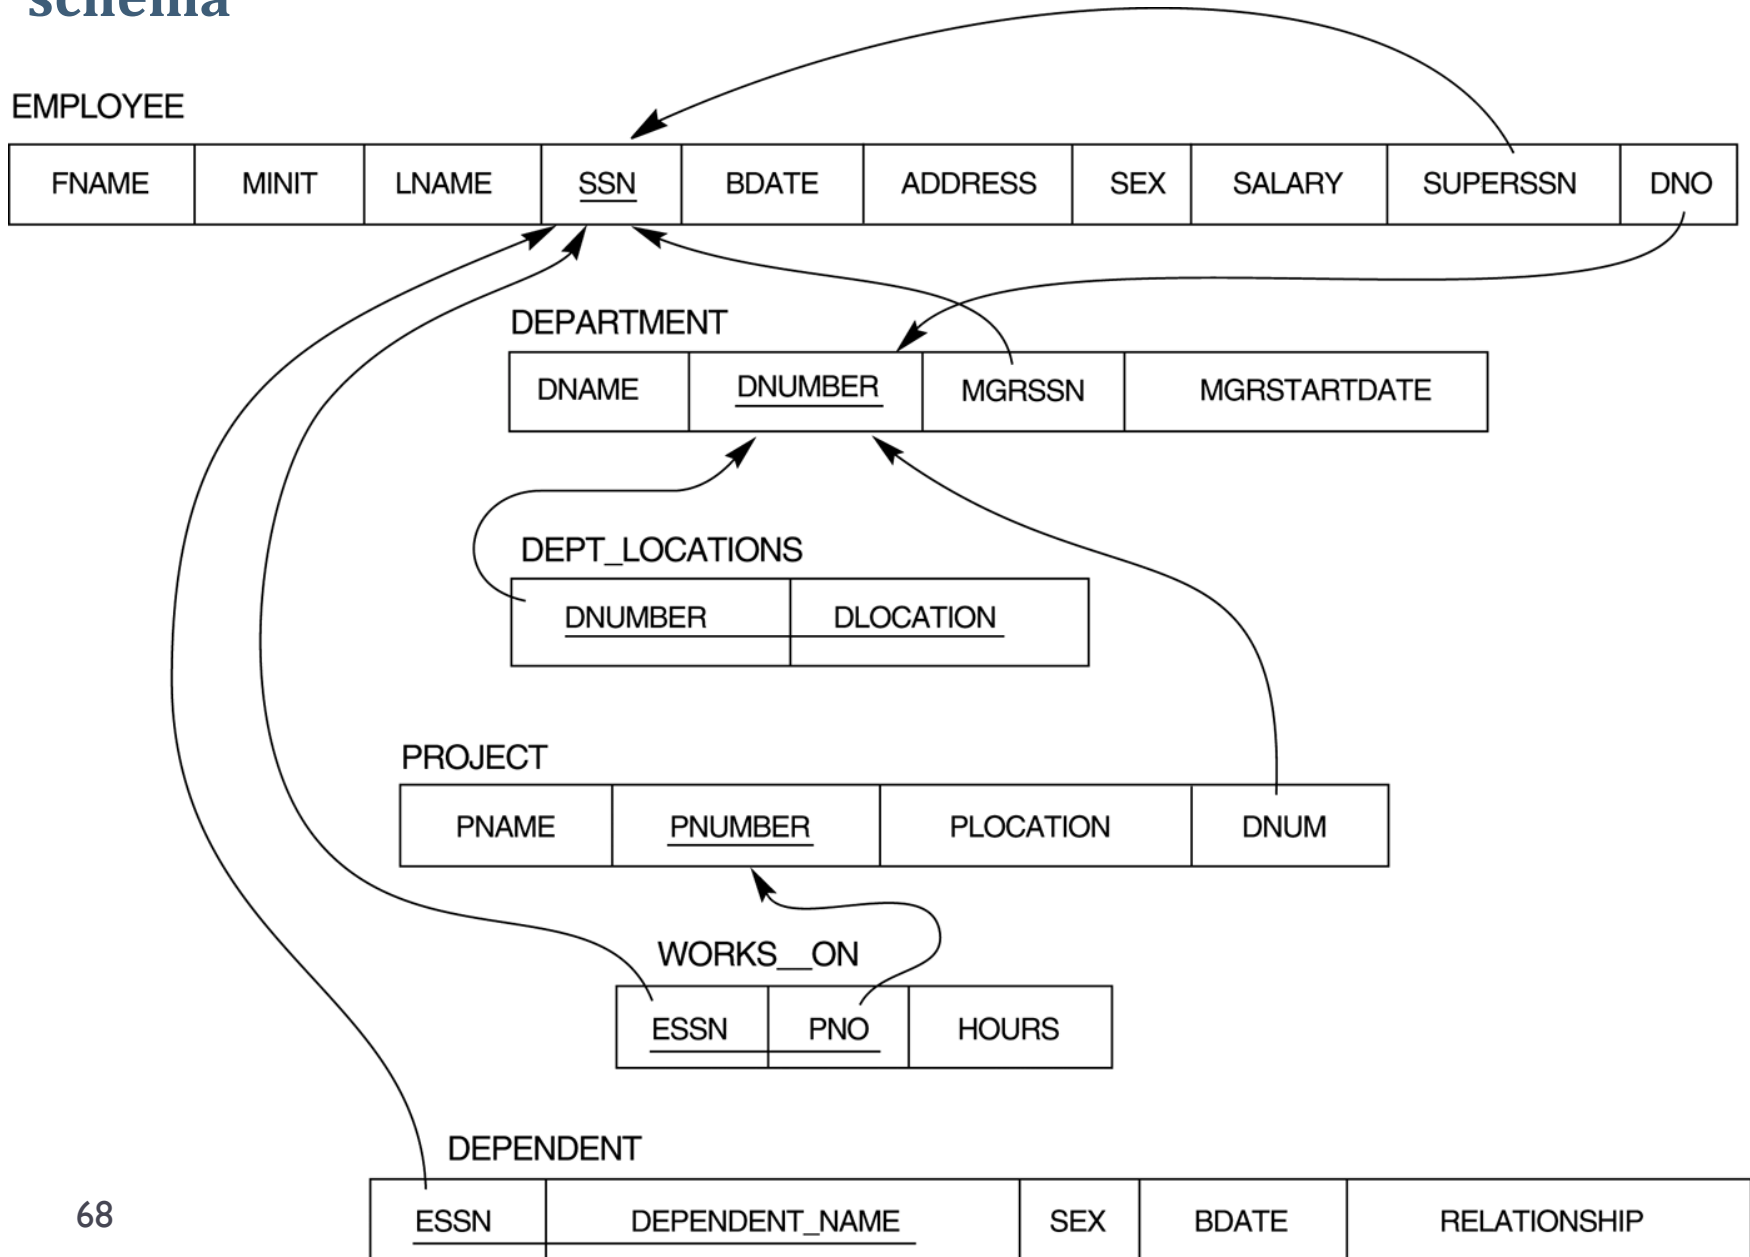

ER-to-Relational Mapping - Step 6: Mapping of Multivalued attributes

- ▶ Step 6: Mapping of Multivalued attributes
 - ▶ For each multivalued attribute A, create a new relation R. This relation R will include an attribute corresponding to A, plus the primary key attribute K-as a foreign key in R-of the relation that represents the entity type or relationship type that has A as an attribute
 - ▶ The primary key of R is the combination of A and K.
 - ▶ If the multivalued attribute is composite, we include its simple components

Example: The relation DEPT_LOCATIONS is created. The attribute DLOCATION represents the multivalued attribute LOCATIONS of DEPARTMENT, while DNUMBER-as foreign key-represents the primary key of the DEPARTMENT relation. The primary key of R is the combination of {DNUMBER, DLOCATION}

Result of mapping the COMPANY ER schema into a relational schema

ER-to-Relational Mapping

▶ ER-

- ▶ Step 1: Mapping of Regular Entity Types
- ▶ Step 2: Mapping of Weak Entity Types
- ▶ Step 3: Mapping of Binary 1:1 Relationship Types
- ▶ Step 4: Mapping of Binary 1:N Relationship Types
- ▶ Step 5: Mapping of Binary M:N Relationship Types
- ▶ Step 6: Mapping of Multivalued attributes
- ▶ **Step 7: Mapping of N-ary Relationship Types**

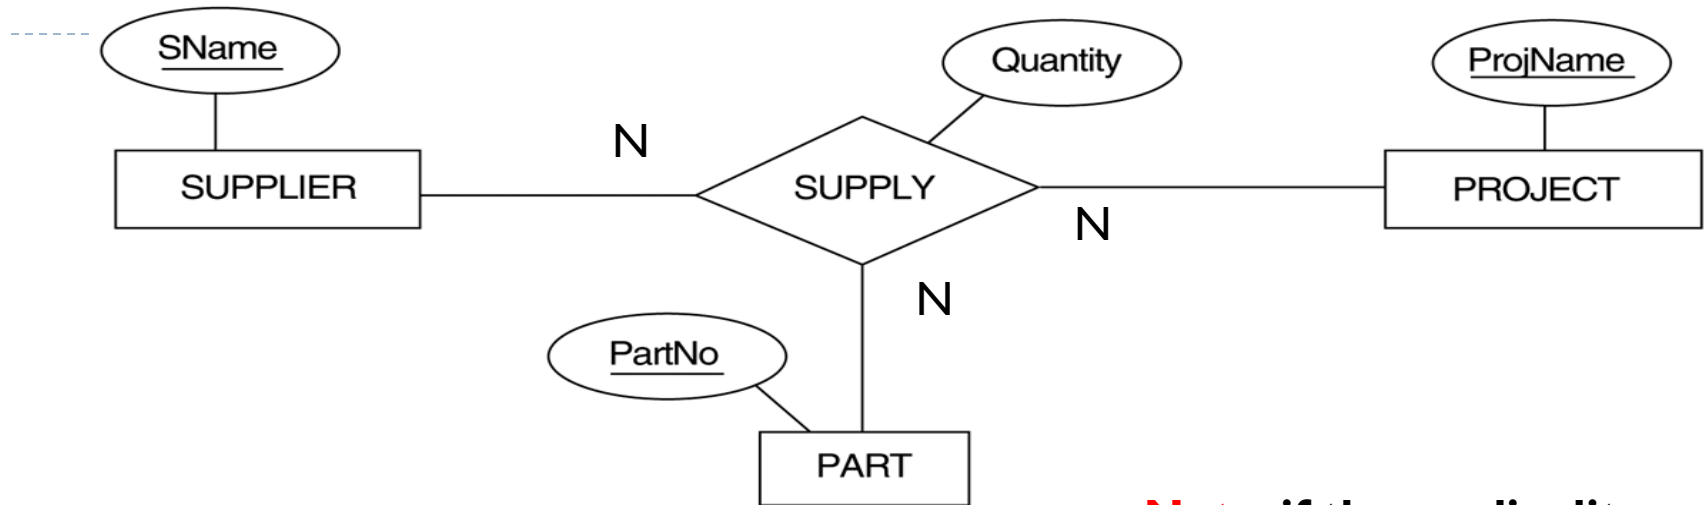

ER-to-Relational Mapping - Step 7: Mapping of N-ary Relationship Types

- ▶ Step 7: Mapping of N-ary Relationship Types
 - ▶ For each n-ary relationship type R, where $n > 2$, create a new relationship S to represent R
 - ▶ Include as foreign key attributes in S the primary keys of the relations that represent the participating entity types
 - ▶ Also include any simple attributes of the n-ary relationship type (or simple components of composite attributes) as attributes of S

Example: The relationship type SUPPY in the ER below. This can be mapped to the relation SUPPLY shown in the relational schema, whose primary key is the combination of the three foreign keys {SNAME, PARTNO, PROJNAME}

ER-to-Relational Mapping

Ternary relationship types: The SUPPLY relationship

SUPPLIER

<u>SNAME</u>	...
--------------	-----

PROJECT

<u>PROJNAME</u>	...
-----------------	-----

PART

<u>PARTNO</u>	...
---------------	-----

SUPPLY

<u>SNAME</u>	PROJNAME	<u>PARTNO</u>	QUANTITY
--------------	----------	---------------	----------

Note: if the cardinality constraint on any of the entity types **E** participating in the relationship is **1**, the **PK** should not include the **FK** attributes that reference the relation **E'** corresponding to **E**

ER- & EER-to-Relational Mapping

▶ ER-

- 
- ▶ Step 1: Mapping of Regular Entity Types
 - ▶ Step 2: Mapping of Weak Entity Types
 - ▶ Step 3: Mapping of Binary 1:1 Relationship Types
 - ▶ Step 4: Mapping of Binary 1:N Relationship Types
 - ▶ Step 5: Mapping of Binary M:N Relationship Types
 - ▶ Step 6: Mapping of Multivalued attributes
 - ▶ Step 7: Mapping of N-ary Relationship Types

▶ EER-

- 
- ▶ Step 8: Options for Mapping Specialization or Generalization.
 - ▶ Step 9: Mapping of Union Types (Categories)

EER-to-Relational Mapping - Step8: Options for Mapping Specialization or Generalization

► Step8: Options for Mapping Specialization or Generalization.

Convert each specialization with m subclasses $\{S_1, S_2, \dots, S_m\}$ and generalized superclass C , where the attributes of C are $\{k, a_1, \dots, a_n\}$ and k is the (primary) key, into relational schemas using one of the four following options:

- Option 8A: Multiple relations-Superclass and subclasses
- Option 8B: Multiple relations-Subclass relations only
- Option 8C: Single relation with one type attribute
- Option 8D: Single relation with multiple type attributes

EER-to-Relational Mapping - Step8: Options for Mapping Specialization or Generalization.

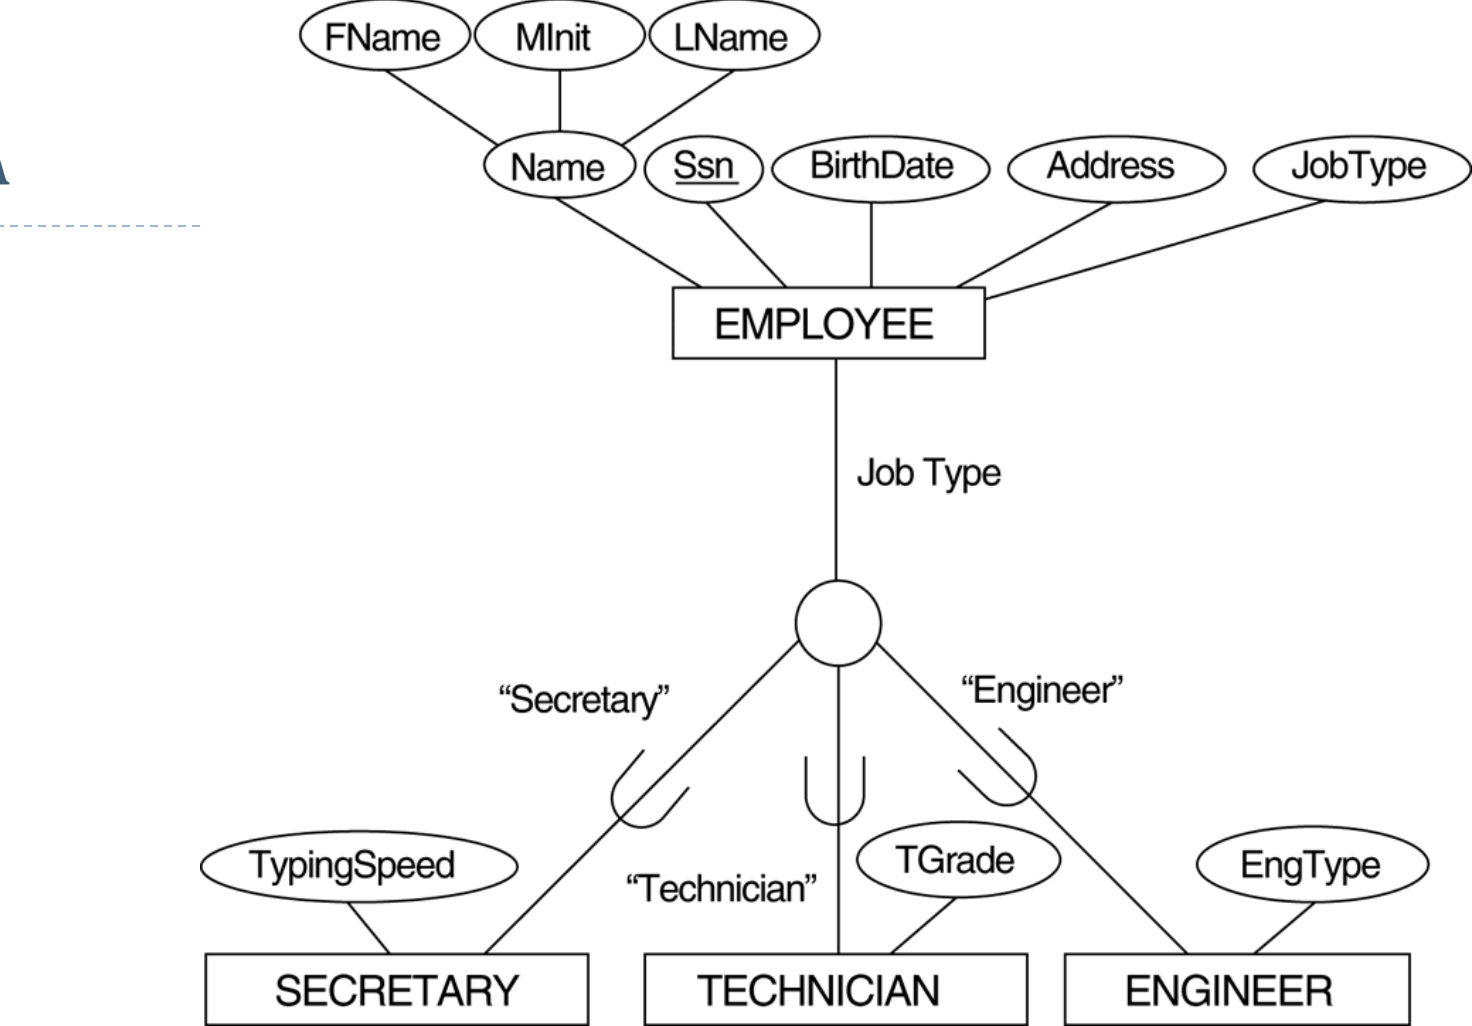

▶ **Option 8A: Multiple relations-Superclass and subclasses**

- ▶ Create a relation L for C with attributes $\text{Attrs}(L) = \{k, a_1, \dots, a_n\}$ and $\text{PK}(L) = k$. Create a relation L_i for each subclass S_i , $1 < i < m$, with the attributes $\text{Attrs}(L_i) = \{k\} \cup \{\text{attributes of } S_i\}$ and $\text{PK}(L_i) = k$.
- ▶ **Works for any specialization** (total or partial, disjoint or overlapping).

▶ **Option 8B: Multiple relations-Subclass relations only**

- ▶ Create a relation L_i for each subclass S_i , $1 < i < m$, with the attributes $\text{Attr}(L_i) = \{\text{attributes of } S_i\} \cup \{k, a_1, \dots, a_n\}$ and $\text{PK}(L_i) = k$.
- ▶ **Works for a specialization whose subclasses are total** (every entity in the superclass must belong to (at least) one of the subclasses).
- ▶ **Recommend if specialization has disjointness constraint.**

Example: Option 8A

EMPLOYEE						
<u>SSN</u>	FName	MInit	LName	BirthDate	Address	JobType

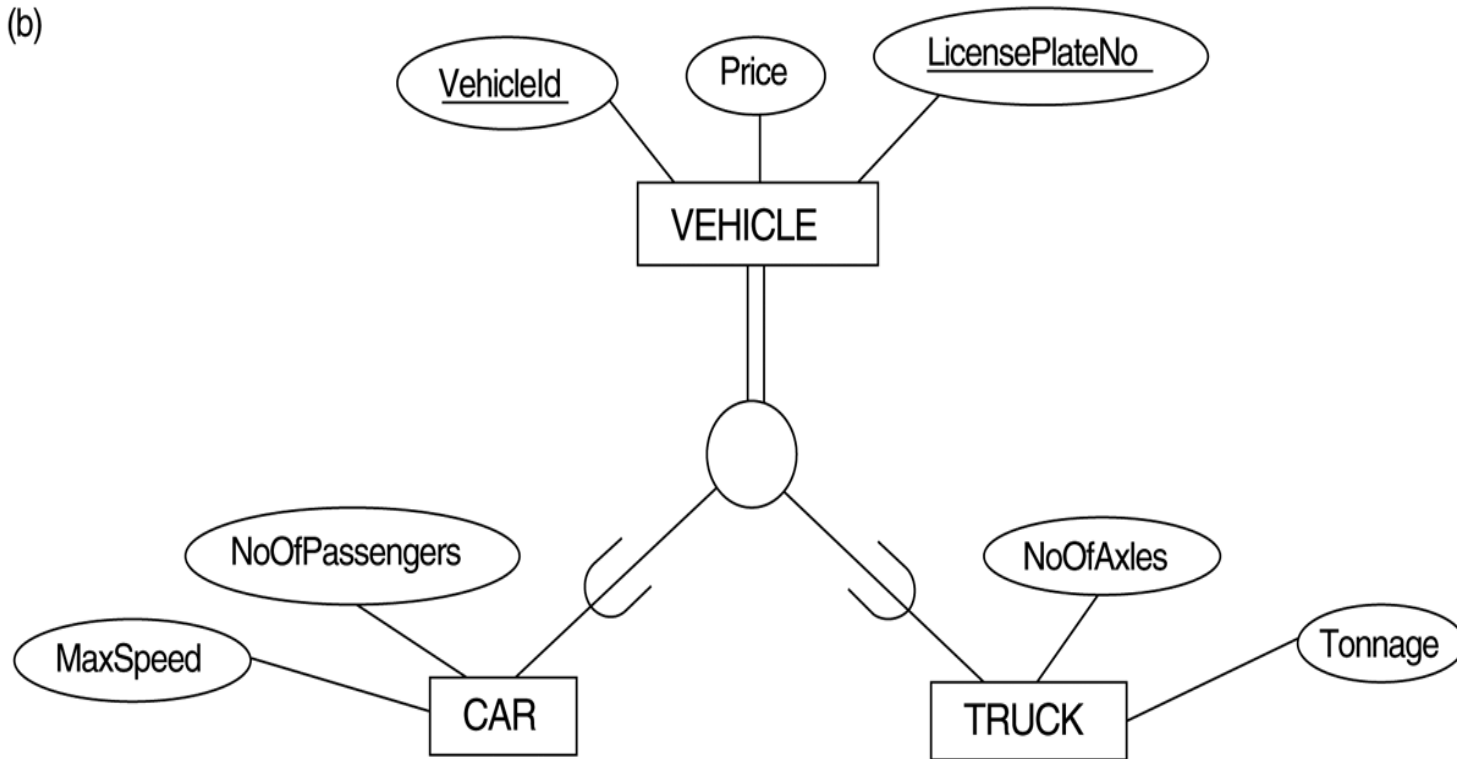

SECRETARY	
<u>SSN</u>	TypingSpeed

TECHNICIAN	
<u>SSN</u>	TGrade

ENGINEER	
<u>SSN</u>	EngType

Example: Option 8B

(b)

CAR

<u>VehicleId</u>	LicensePlateNo	Price	MaxSpeed	NoOfPassengers
------------------	----------------	-------	----------	----------------

TRUCK

<u>VehicleId</u>	LicensePlateNo	Price	NoOfAxles	Tonnage
------------------	----------------	-------	-----------	----------------

EER-to-Relational Mapping - Step8: Options for Mapping Specialization or Generalization

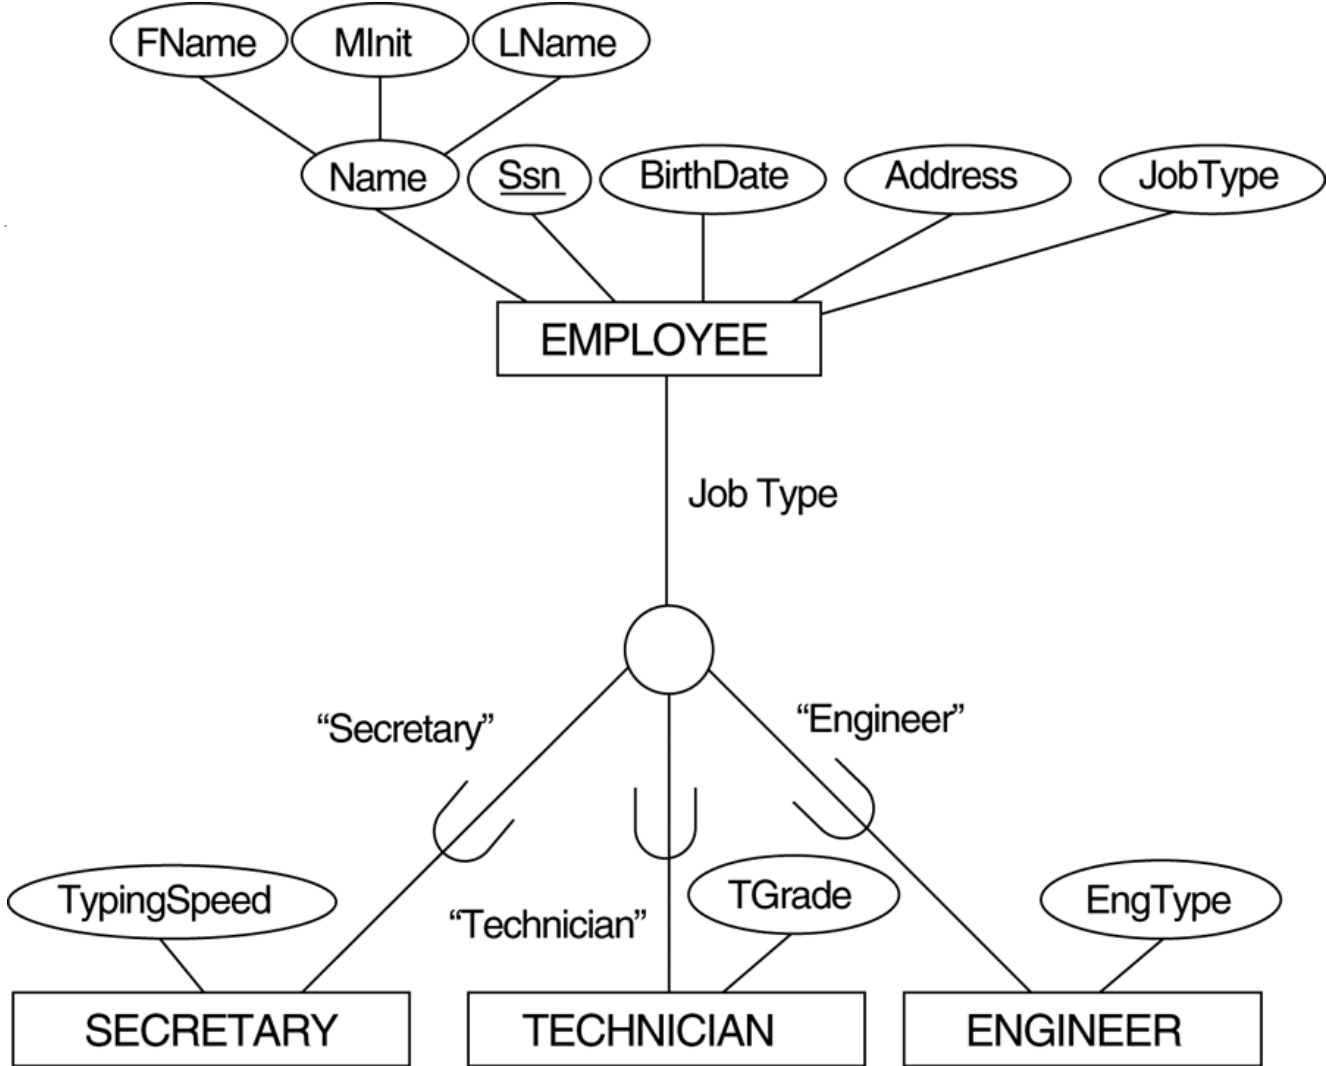

► Option 8C: Single relation with one type attribute

- Create a single relation L with attributes $\text{Attrs}(L) = \{k, a_1, \dots, a_n\} \cup \{\text{attributes of } S_1\} \cup \dots \cup \{\text{attributes of } S_m\} \cup \{t\}$ and $\text{PK}(L) = k$.
- The attribute t is called a type (or **discriminating**) attribute that indicates the subclass to which each tuple belongs.
- **Works only for specialization whose subclass are disjoint.**

► Option 8D: Single relation with multiple type attributes

- Create a single relation schema L with attributes $\text{Attrs}(L) = \{k, a_1, \dots, a_n\} \cup \{\text{attributes of } S_1\} \cup \dots \cup \{\text{attributes of } S_m\} \cup \{t_1, t_2, \dots, t_m\}$ and $\text{PK}(L) = k$.
- Each t_i , $1 < i < m$, is a Boolean type attribute indicating whether a tuple belongs to the subclass S_i .
- **Used for specialization whose subclass are overlapping.**
- **Will also work for a disjoint specialization.**

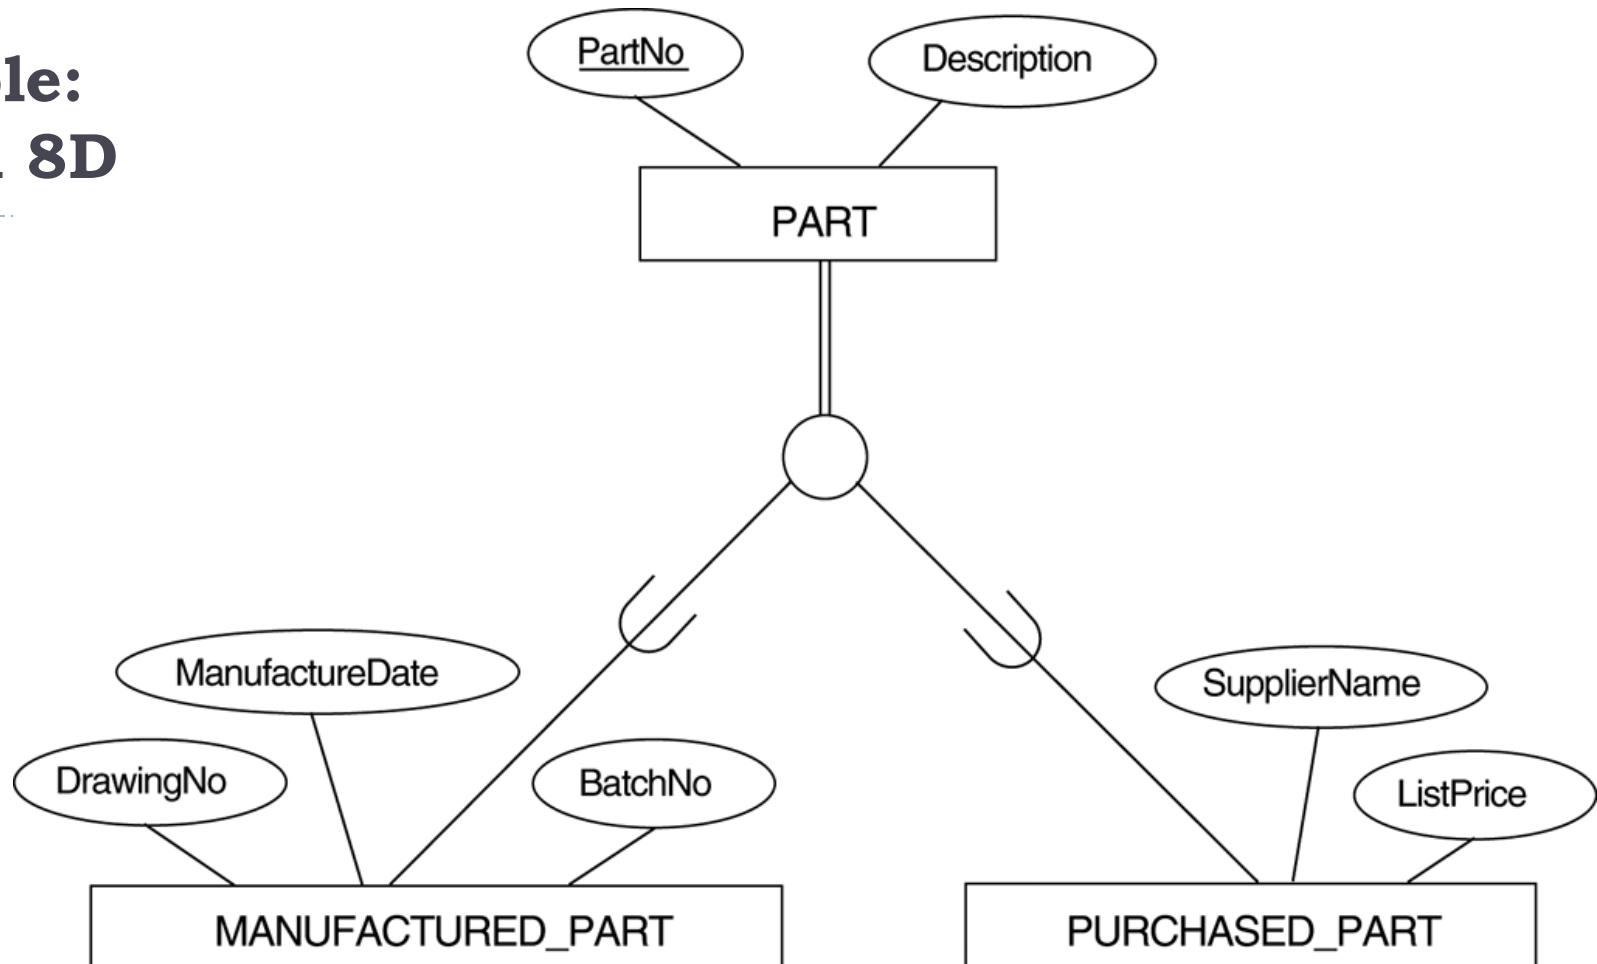

Example:
Option 8C

EMPLOYEE

<u>SSN</u>	FName	MInit	LName	BirthDate	Address	JobType	TypingSpeed	TGrade	EngType
------------	-------	-------	-------	-----------	---------	---------	-------------	--------	----------------

Example: Option 8D

PART

<u>PartNo</u>	Description	MFlag	DrawingNo	ManufactureDate	BatchNo	PFlag	SupplierName	ListPrice
---------------	-------------	-------	-----------	-----------------	---------	-------	--------------	-----------

EER-to-Relational Mapping - Step8: Options for Mapping Specialization or Generalization

- ▶ Mapping of Shared Subclasses (Multiple Inheritance)
 - ▶ A shared subclass, such as STUDENT_ASSISTANT, is a subclass of several classes, indicating multiple inheritance. These classes must all have the same key attribute; otherwise, the shared subclass would be modeled as a category.
 - ▶ We can apply any of the options discussed in Step 8 to a shared subclass, subject to the restriction discussed in Step 8 of the mapping algorithm. Below both 8C and 8D are used for the shared class STUDENT_ASSISTANT.

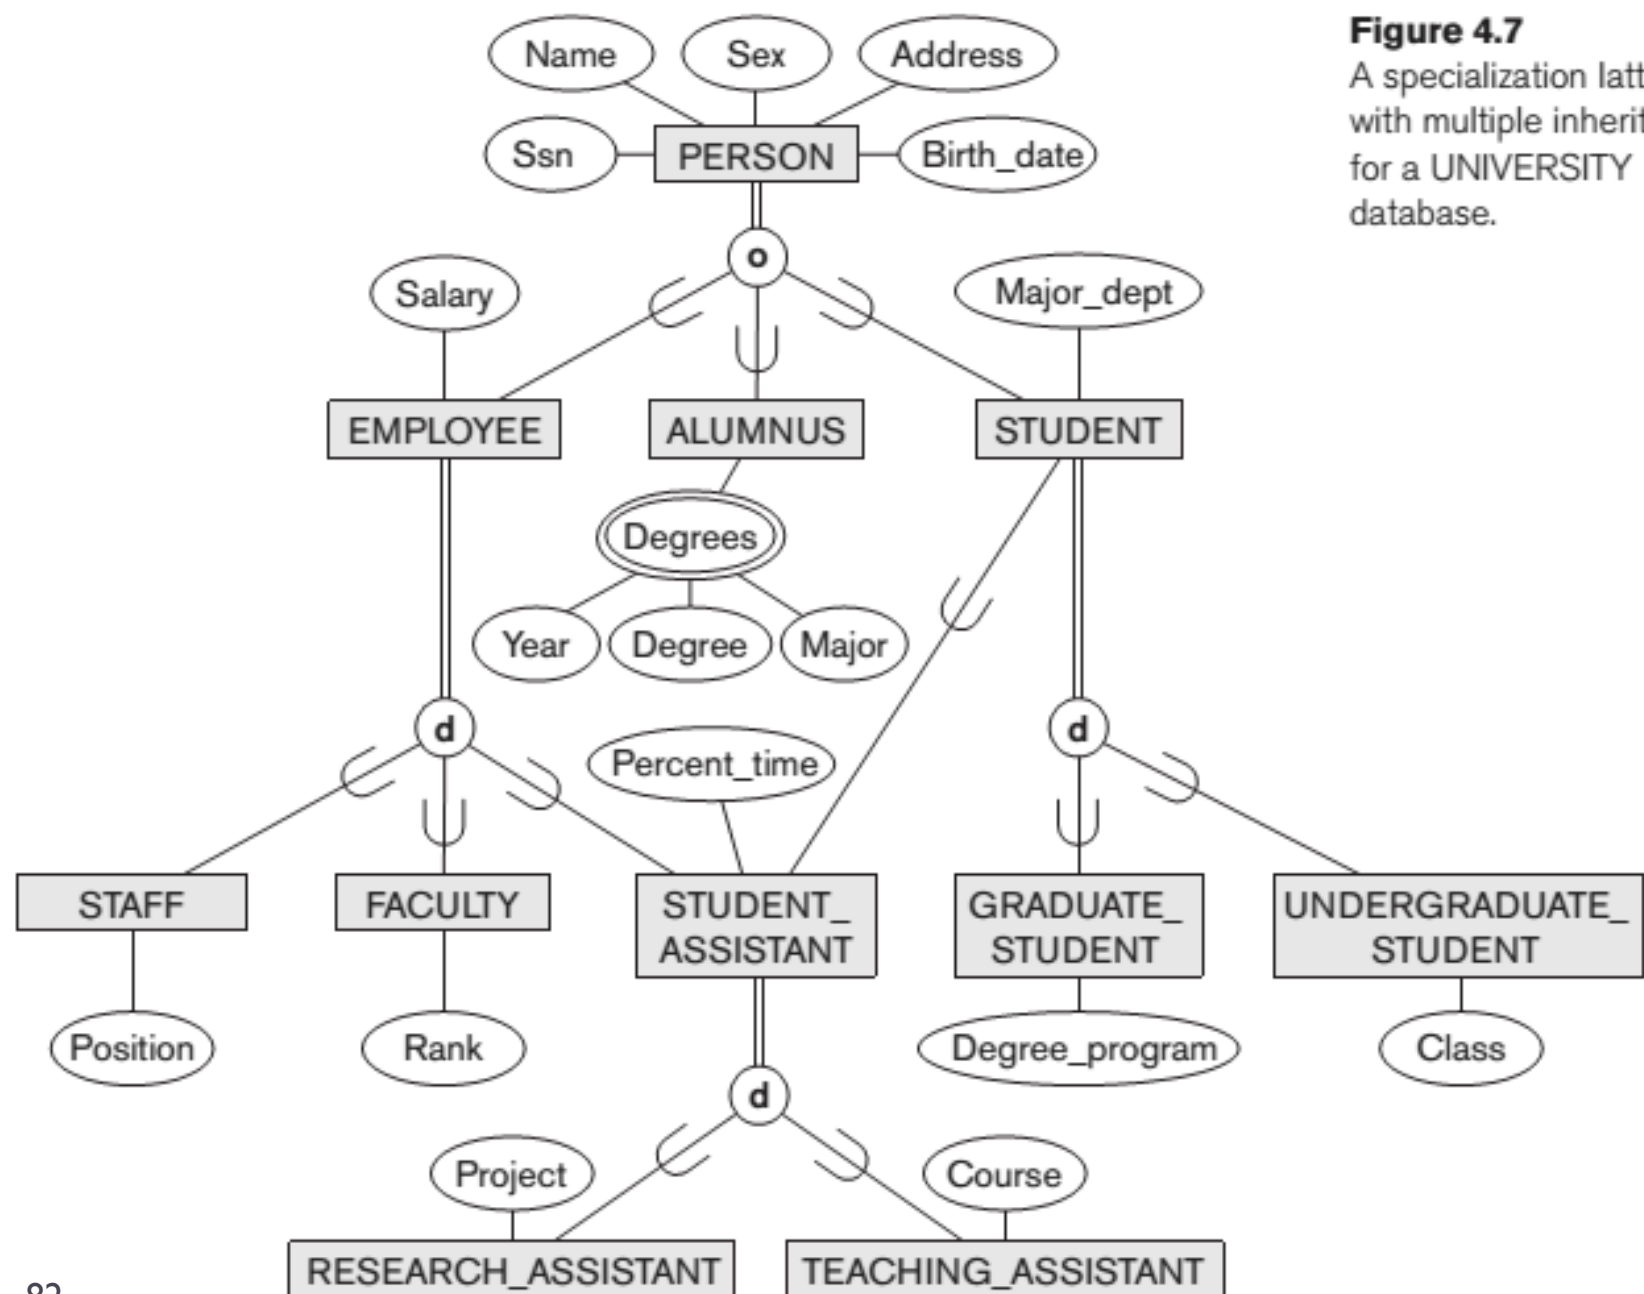

Figure 4.7

A specialization lattice with multiple inheritance for a UNIVERSITY database.

Example: Mapping of Shared Subclasses

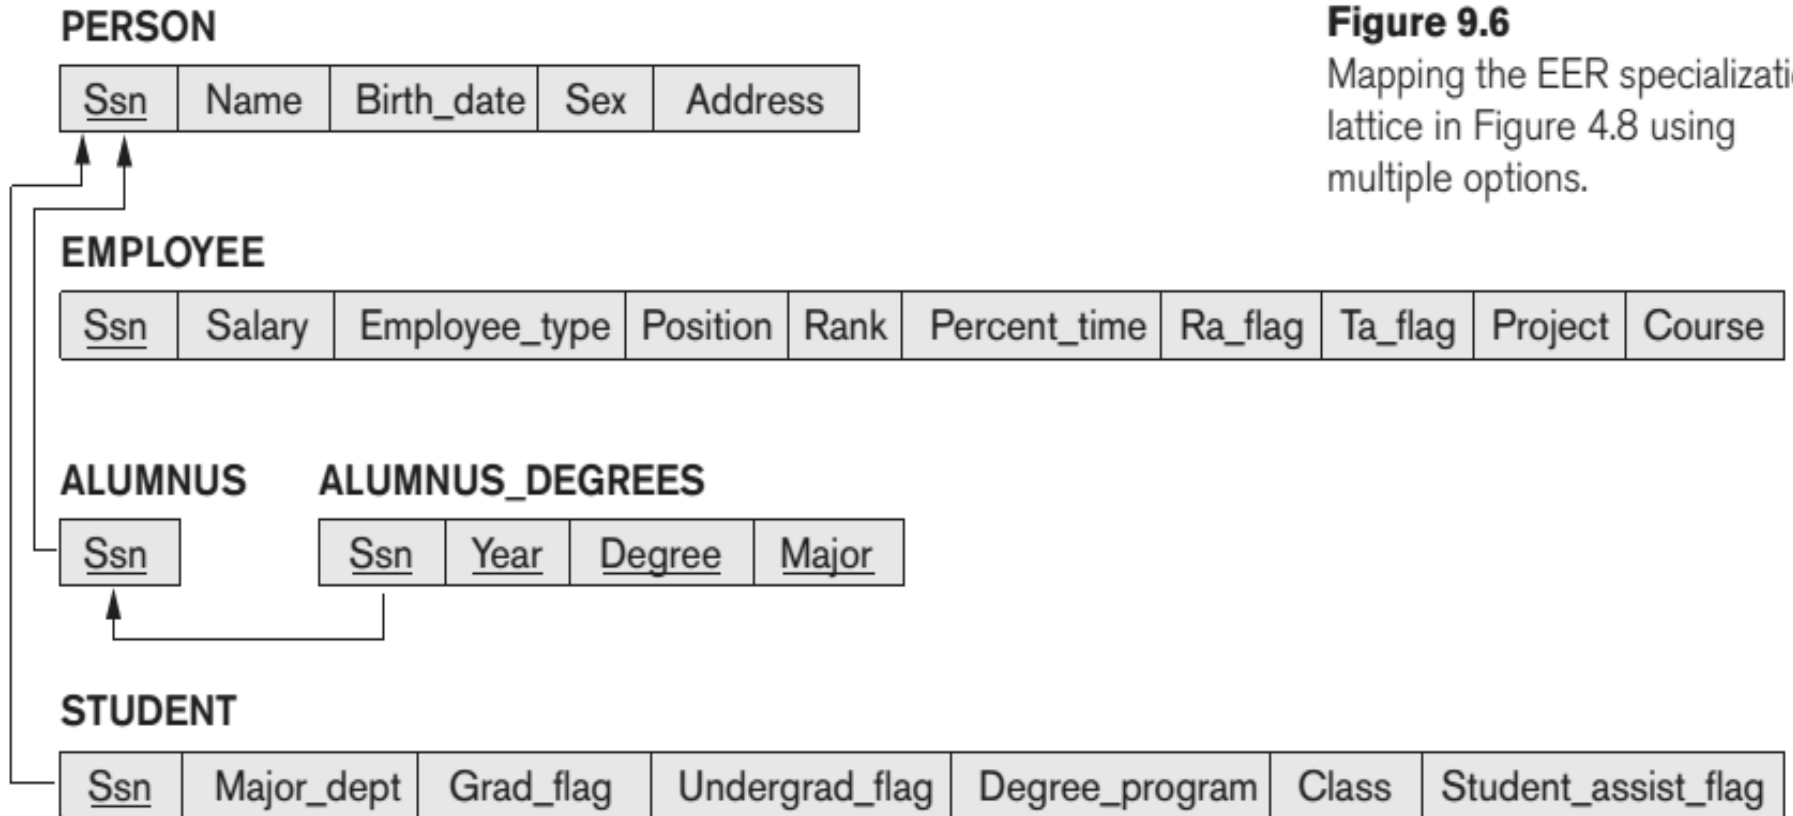

Figure 9.6

Mapping the EER specialization lattice in Figure 4.8 using multiple options.

ER- & EER-to-Relational Mapping

▶ ER-

- ▶ Step 1: Mapping of Regular Entity Types
- ▶ Step 2: Mapping of Weak Entity Types
- ▶ Step 3: Mapping of Binary 1:1 Relationship Types
- ▶ Step 4: Mapping of Binary 1:N Relationship Types
- ▶ Step 5: Mapping of Binary M:N Relationship Types
- ▶ Step 6: Mapping of Multivalued attributes
- ▶ Step 7: Mapping of N-ary Relationship Types

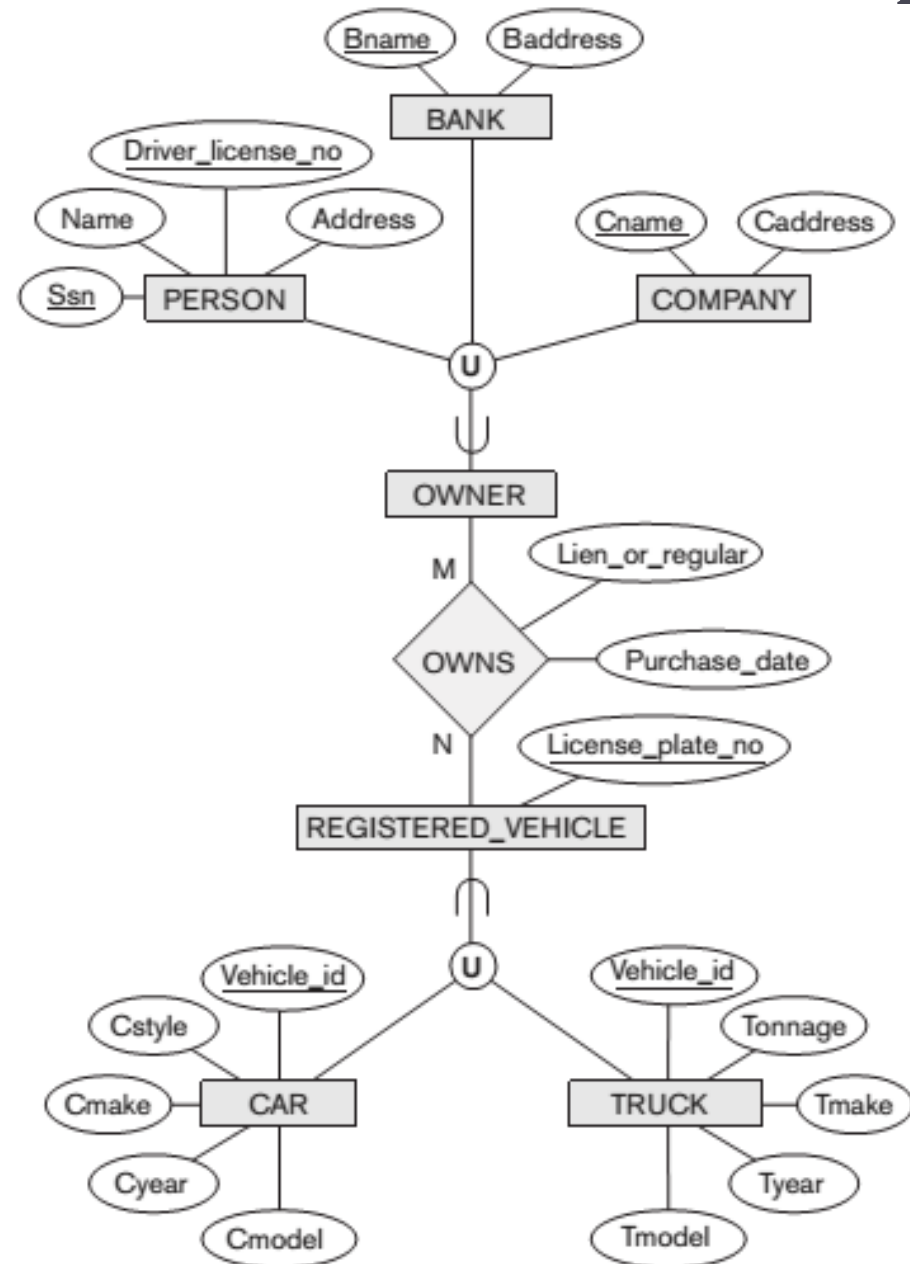

▶ EER-

- ▶ Step 8: Options for Mapping Specialization or Generalization.
- ▶ **Step 9: Mapping of Union Types (Categories)**

EER-to-Relational Mapping - Step 9: Mapping of Union Types (Categories)

- ▶ **Step 9: Mapping of Union Types (Categories).**
 - ▶ For mapping a category whose defining superclass have different keys, it is customary to specify a new key attribute, called a **surrogate** key, when creating a relation to correspond to the category.
 - ▶ In the example below we can create a relation OWNER to correspond to the OWNER category and include any attributes of the category in this relation. The primary key of the OWNER relation is the surrogate key, which we called OwnerId.

Example: Mapping of Union Types

PERSON

<u>Ssn</u>	Driver_license_no	Name	Address	Owner_id
------------	-------------------	------	---------	----------

BANK

<u>Bname</u>	Baddress	Owner_id
--------------	----------	----------

COMPANY

<u>Cname</u>	Caddress	Owner_id
--------------	----------	----------

OWNER

<u>Owner_id</u>

REGISTERED_VEHICLE

<u>Vehicle_id</u>	License_plate_number
-------------------	----------------------

CAR

<u>Vehicle_id</u>	Cstyle	Cmake	Cmodel	Cyear
-------------------	--------	-------	--------	-------

TRUCK

<u>Vehicle_id</u>	Tmake	Tmodel	Tonnage	Tyear
-------------------	-------	--------	---------	-------

OWNS

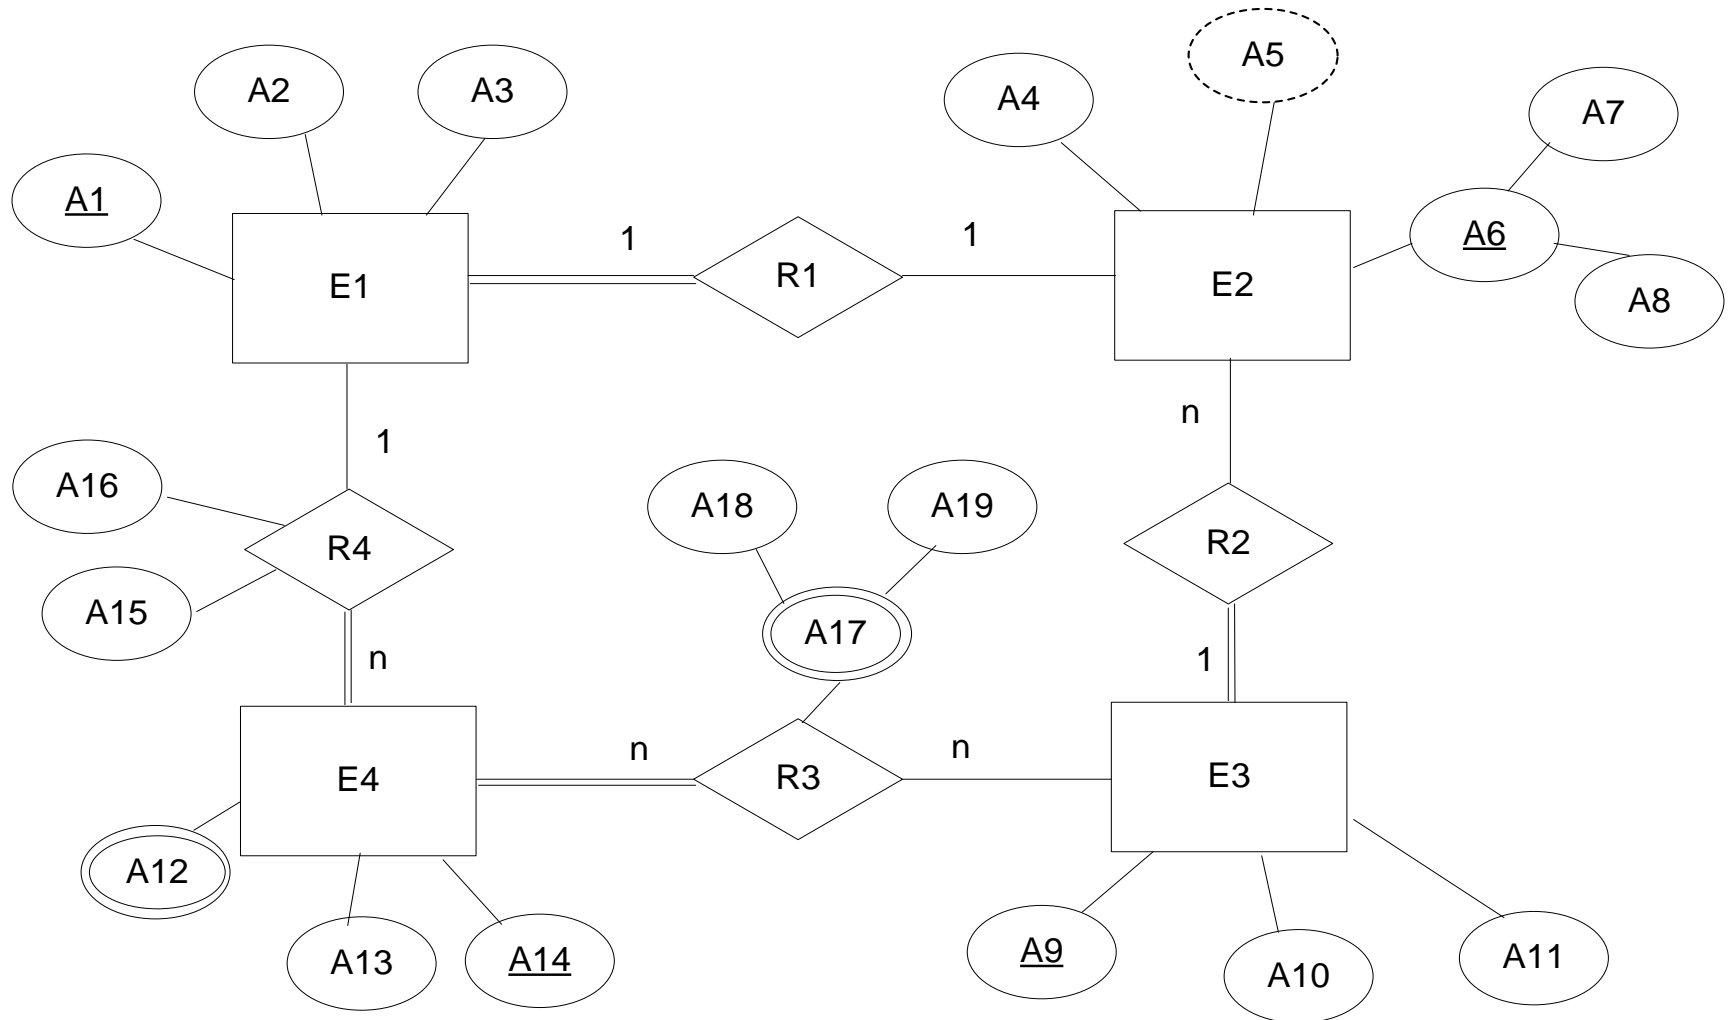

<u>Owner_id</u>	<u>Vehicle_id</u>	Purchase_date	Lien_or_regular
-----------------	-------------------	---------------	-----------------
